Please guys don't tell me you are so stupid as to believe this is real.

For openers look at the headers, it originated in the US Dr. Meizner is in Germany.

This post is a very counter productive cowardly piece of work and the poster is a real lowlife.

Go back to 75m troll.

I think the best advice your going to get is to move the computer
as far from the radio as you can and plug it into a different circuit
in the house if you can. I have tried numerous things and short of
putting the computer in a lead lined box there's not much else that
I have found to work.

Best of luck.

Scott (VP9MM and VA3XA)

1152. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.space
Date: 1998-05-15 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6jgqs6$ltl@news.Hawaii.Edu>
Source record: 16079
Cross-posted to: rec.radio.amateur.space,rec.answers,news.answers

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists
==========

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I am not sure it is bad news. The ARIANE 5 has failed in its last two launches, we, the Ham Satellite community would have lost in a very large way if P3D was aboard those flights. Hopefully an ARIANE 4 bird or something more concrete will come along.

1154. Apartment Antenna Question

Newsgroup: rec.radio.amateur.space
Date: 1998-05-15 00:00:00 UTC
From: stefanie@mindspring.com
Message-ID: <355c42f1.89275526@news.mindspring.com>
Source record: 16081

I am located on the top floor of a 3 story apartment in Atanta. I am curious to know if there are any hams working sats with a similar situation. As the restrictions prevent outside antennas, I was wondering whether the attenuation of an antenna put up inside the roof would kill my chances of decent contacts/reception. I have about 60' of horizontal space and 12' of vertical space in the attic.

I sure would appreciate any tips on installations and antenna types (i.e. eggbeaters).

73's,

Grant - W4GNS

Ariane 502 did *not* fail. All launches have anomalies (consider
the number of parts in an Ariane 5/Shuttle/Proton, and then consider
the expected failure rate). If we can live with the anomalies,
then the launch is a success. You obviously didn't do any
delta v calculations for P3D in 502's orbit, or look at any
ground tracks...

With all due respect, go-ariane is not official. I'll believe
it when I hear it from CNES, esa or Arianespace.

While technically true ... 502 would probably have cut the useful life
of P3D in half (considering the extra fuel that would have been needed
to achieve its correct orbit ... compared to where 502 engines
shutdown).

Marshall,
I have been working RS-12 with a 10m turnstile on the downlink into a portable sw radio (Grundig YB-400). My 2m uplink is an Icom IC-211 into a 5/8 wave ground plane antenna. The uplink suffers a bit on direct overhead passes. Aside from that the antenna works fine. An eggbeater or lindenblad antenna would work better on the uplink for the overhead passes.

>Noaa satellites.

I reckon I picked up a pass by accident this morning (over the UK) on
the NOOA 12 channel and running between 40 and 45 mins behind 12.

The signals seemed weaker (fading out much closer north and south of me)
and as yet the colour settings for WXSat are not the same - maybe
different instruments being used, or various tests being carried out. On
the picture I got the land deatils seemed better but the cloud detail
was 'over exposed'. It is early days yet though!

I will get a .wav from it next time and see how the settings compare as
I only took a .bmp on that pass.

Good WXsat hunting. John M1BTR

The above make a big difference. Other things you could try--

If there's interference coming from your monitor, or if too much of your computer's case is plastic rather than metal, you can try spraying the inside of the plastic bits (taking the circuit boards out first!) with nickel screening compound. This is a *very* messy job, but I'd guess it reduced the noise from my monitor by about 50%.

Switch off things like modems and printers if you're not actually using them, or give them the nickel spray treatment. In my experience these cause more interference than the computer.

Anyone know how the ground control stations manage?

I do not know why I did not receive this newsgroup article, I wish I had.

In the world of rocketry, when something deviates more than a couple of percent resulting in a outcome that is not modifiable, its a failure. A little 'O' ring "anomaly" had deviating consequences with the shuttle. A software "anomaly" destroyed a Delta. I won't even get into Vangaurd.

The Ariane 5, no matter how well engineered, is a new launch platform that has yet to prove itself.

So, how much money has Amsat given to ESA? How much monies are in the till? Where do I find these things out? The Soviet block has proven booster technology at I would imagine bargain basement prices.

It is true that Russia has the ability to launch satellites for about 1/10 th
the cost of Ariane.

Unfortunately, because of an international agreement, Russia, Ukraine and China
are not permittted to undercut western launch companies by more than 7 %.

Try going to the NOAA website below.
NOAA-15 has a dual slope detector in it.(E.G. Not linear/Higher sensitivity
in the low light areas)
It needs a different calibration to decode correctly.

http://psbsgi1.nesdis.noaa.gov:8080/OSDPD/OSDPD.html

Thes are the keps I have for NOAA-15.
They seem to be ok.

HUH? Why? We normally want a fairly highly inclined orbit, 40 to 50 degrees, right? While launching from the equator does provide a little free delta vee, the plane change is (as always) VERY expensive in terms of delta vee. With the higher latitude of the Russian launch site and the bigger rocket, they *MIGHT* be able to launch directly into our desired orbit plane and put a lot more payload mass up as well.

The physics argue that a Russian launch would provide results that are superior to any eqitorial launch. The problem here is economic and political. I claim ignorance in these areas. However I fear that most anybody who shows up on this newsgroup claiming expertise is mistaken. In these areas, people who know don't talk and people who talk don't know... :-(

1166. AMSAT vs. Globalstar

Newsgroup: rec.radio.amateur.space
Date: 1998-05-16 00:00:00 UTC
From: David Anderman <davida@cwo.com>
Message-ID: <355DE3A8.886E859A@cwo.com>
Source record: 15995
Cross-posted to: rec.radio.amateur.space,sci.space.policy,rec.radio.amateur.policy

I have to ask this somewhat rudimentary question:

I understand that the more recent AMSAT spacecraft have development and manufacturing costs in the (low) millions of dollars, a figure considered 'cheap' in the industry, because of the reliance on volunteer labor.

However, Globalstar comsats are being produced at similar prices ($13 million).

How is that the much larger and capable Globalstar comsats cost just a little more than the AMSAT spacecraft?

is published every week and is made available for non-commercial use.

* LMCC DEMANDS 70-CM BAND FOR COMMERCIAL USE *
==========
The Land Mobile Communications Council has issued a demand to the FCC that
it immediately reallocate of most of the 70 centimeter Amateur band over
to private mobile operations with private land mobile designated as the
primary user.

Technically the document is nothing more than a formal rule making request
to the FCC that has been designated RM 9267. In reality it is more a demand
by the LMCC for the FCC to immediately reallocate 420 to 430 MHz and 440 to
450 MHz away from the federal government and over to the Private Mobile Radio
Service on a primary basis. The Land Mobile Communications Council is also
asking for new allocations at 1390 to 1400 MHz, 1427-1432 MHz, and 1670 to
1675 MHz. It is also demanding a walloping 85 MHz at 960 to 1215 MHz and
it wants all of this turned over to the Private Mobile Radio Service no
later than 2010.

But LMCC is not willing to wait until 2010 to take over the 70 centimeter
band even though this is the second most popular of the Amateur radio
services' VHF and UHF allocations. Amateur Radio is a secondary user of
420 to 450 MHz. There are thousands of FM repeaters operating from 440 to
450 MHz and a variety of modes on the air every day in the 420 to 430 MHz
segment. While the Land Mobile Communications Council petition indicates
that it is willing to permit Amateur Radio to retain some sort of secondary
status, this would be only on a non-interfereing basis with the new commercial
interests.

Experts say that the best way to kill RM 9267 is though a massive letter
writing campaign to the FCC. A campaign that outlines the specific use of
the band by Amateur Radio Interests -- informational filings that detail how
every hertz of 420 to 430 and 440 to 450 MHz is utilized on a day to day
basis by hams.

The commentary cutoff date on RM 9267 is June 1st. This leaves precious little time for radio amateurs around the nation to react. Those responding must be certain to reference RM 9267 at the top of their letter. Send comments to the Secretary, Federal Communications Commission, Washington DC, 20554.

[Info via Newsline 1082 released 1998-May-08 from Bill Pasternak, WA6ITF]

* OSCAR-11 NEWS *
==========
During the period 1998-Apr-16 to 1998-May-15, good signals have been received from UoSAT-OSCAR-11 via the 145.826 MHz beacon. It has been an uneventful period.

Telemetry has shown that the battery voltage has tended to rather low, mostly around 13.5 volts, with values between 13.3 and 14.0 volts recorded. No explanations of the changed power supply currents (as reported last month) have been received, therefore these values will now be regarded as nominal.

The internal temperatures have remained fairly constant at around 5C and 3C for battery and telemetry electronics respectively.

A single WOD survey of channels 1, 2, 3, 61 (magnetometers) dated 1998-Mar-19 has been transmitted by the satellite. A quick plot of this WOD showed reasonable agreement with the theoretical field and nominal attitude. Anyone using this survey should note the unusual starting time of 16:00:05 UTC.

Three reports of the OSCAR-11 Mode-S beacon have been received from Fernando CX6DD, Gary N4OLN, and Steve HB9FMX/G4KAM. Of special interest is the equipment used by CX6DD. This a modified MMDS commercial TV antenna, model 130194, made by California Amplifier Inc. The device which is known as an LNBY, consists of a 23 element antenna, 60 cm long, where each element is a 4.5 cm disc, and an integrated down converter which forms the remainder of the antenna. There is sufficient space inside the unit to allow a cheap surplus HC-6 crystal to be used instead of the original HC-49 type. A 8.8125 MHz crystal would give an IF in the 145 MHz band. An ICOM 821H and FODTRACK software completed the system. The audio file that Fernando sent showed excellent reception. The price of the antenna (in Uruguay) was US $190. Further details can be found on the California Amplifier web site http://www.calamp.com/ (Use the search facility to find 130194).

The operating schedule is unchanged.

ASCII status (210 seconds)
ASCII bulletin (60 seconds)
BINARY SEU (30 seconds)
ASCII TLM (90 seconds)
ASCII WOD (120 seconds)
ASCII bulletin (60 seconds)
BINARY ENG (30 seconds)

The ASCII bulletin is currently a static message, detailing modes and frequencies of all the amateur radio satellites.

There are additional status blocks after each bulletin is transmitted, and between ASCII TLM and WOD.

The Mode-S beacon is ON transmitting an unmodulated carrier, but telemetry indicates that it has partially failed, and delivering half power. This beacon is a useful test source for those testing Mode-S converters, prior to the launch of P3-D. It is considerably weaker than DOVE-OSCAR-17, which should be used for initial testing. Any reports of reception of the 2401 MHz beacon would be most welcome, and should be directed to Clive Wallis at: g3cwv@amsat.org.

The 435.025 MHz beacon is normally OFF. However it can sometimes be heard when the satellite is being commanded by ground control, ie. within range of Guildford, UK. When the 435 MHz beacon is transmitting, the 145 MHz beacon is normally OFF. The data transmitted is mainly binary.

In response to many requests for information about methods of decoding OSCAR-11 signals, Clive Wallis has added a package of hardware information to his OSCAR-11 web site.

Another recent addition is a new page for miscellaneous topics such as tracking, eclipses, and orbital decay. The first addition to this new page is a package for evaluating satellite eclipses, as described in OSCAR News April 1998, page 29. The other item in this new page is a program OZFORM.BAS for generating a table of Keplerian elements from the NASA 2-line format. The format of the output is similar to that published in every issue of OSCAR News.

The web site also contains some software for capturing data and decoding ASCII telemetry and WOD. There is an archive of raw data (mainly WOD) for analysis, which is continually being expanded as new data is captured. Also included are some audio files, including 10-second examples of each type of data transmitted by OSCAR-11. There are also examples of Mode-S reception. All the audio files are zipped so that they can be played off-line. These should help listeners identify the various types of data, and give an indication of the signal quality required for successful decoding.

Clive's OSCAR-11 Web Site may be accessed by connecting to the following URL:

http://www.users.zetnet.co.uk/clivew/

I have never heard that P3D costs $13 million. I would say [if I
guess] about $1.5 million at the most. Someone educate me.

1174. New England balloon launch May 30

Newsgroup: rec.radio.amateur.space
Date: 1998-05-17 00:00:00 UTC
From: h1riley@umassd.edu
Message-ID: <355f2b4a.0@gatekeeper.umassd.edu>
Source record: 16003

A ham radio equipped weather balloon will be launched between
1:00 and 2:00 PM, unless adverse weather interferes, from the
upcoming National Weather Service Open House on May 30 in Taunton,
Massachusetts. In case of a postponement, we'll try Sunday, May 31.

The SkyQuest hamradiosonde can be heard on home scanner radios and
VHF ham radios on the 2 meter band at 145.61 MHz FM. It should
be real* easy to hear all over eastern Massachusetts, Rhode Island,
southern New Hampshire, and northeastern Connecticut. After gaining
some substantial height I hope amateur radio operators with more
sensitive receivers will be able to hear the radiosonde from as far
away as southern Connnecticut, New York, New Jersey, Vermont, northern
New Hampshire, and Maine. Maybe even parts of eastern Canada at peak
altitude.

Two temperature channels (inside and out) and altitude will be
measured continuously by means of audio tones. The tones will be
heard for the duration of the flight, going up and down in frequency
as the transmitter switches among the three channels. There will be
an occasional morse code ID.

There is some preliminary information available at the North American
balloon launch website (listed below), but a better way to keep up
with developments (exact launch time, weather forecast, expected flight
track, reception tips, etc.) is to email me with a request to be added
to the SkyQuest mailing list.

Hank Riley, N1LTV

I'm using STSorbit plus with Win95 no problems. Have been since 95 came out.
I use it in full screen mode and I can easily pop in and out to do other
things.

I agree @ STSPlus and run it in WIN 95 w/ 486 DX 100 no problem. Dave Ransom gives good support / resoponse for questions. NOVA also nice= I like STSPlus for user interface but I'm not contrrolling antennas/radios in my setup. As long as STSPlus OK in WIN95 for me it's great. When I start controlling radios/AZ/EL rotors etc. then things probably change. Good luck de Chris NQ4E in Richmond, VA

1177. JStation FAQ

Hi,

I have compiled a list of the most common problems of installing and running JStation.

It seems the most common problem is caused by using either a program to unzip or copy files that does not maintain long file names and the upper/lower case.

If you are having problems, or intend to install JStation, take a look at the following URL:

I don't know that your comparison is just for the cost of the bird, or for the cost of the bird and the lift, but one answer might be that the P3D bird is a "one-time" build, with all costs absorbed in a single unit, while the Globalstar is a multi-unit build and the non-recurring costs are amortized over several units.

Just some thoughts....

Huh, what a weird deal. Ariane can gift Amsat a cut rate launch, but
the Russians can't sell them a launch lass than 7% cheaper than the Arianne
commercial rate? Am I reading this right? I assume that the launch would still
be like 10% of 30M or about 3M, right? Are we really sure this would apply
to something like Amsat -- since the launch cost is below market anyway.
(Maybe it's a moot point since they're not redesigning P3D and nobody has
the 3M anyway.)

Its not weird at all. Consider if ESA was/is giving AMSAT a "free ride" but asked AMSAT to pick up logistical/integration costs. Its still a "free ride" which no trade agreement would come into play, it's charity, hard to condemn.

I do wonder if we could leverage "Goodwill" against the trade agreement to obtain a low cost Soviet flight. I guess the problem would be the world saying "well look, AMSAT did it". You just got to love human nature...:-)

Until you have a more reasonable number for the AMSAT satellite this
discussion is meaningless. Two million dollars is in the "low millions"
but it's 1/6 the cost of Globalstar.

Now that I've said that, I suspect that Globalstar can take advantage
of economies of scale from mass production.

The planned orbit calls for the classical Molniya 63.4 degree inclination, and it is not at all coincidence that the Russians (who pioneered such orbits, and who use them extensively for communication and broadcast satellites) have a launch site at almost exactly this latitude (Plesetsk, 63 degrees north). Orbital plane changes *are* expensive - see, for example, Bate, Mueller and White.

> The problem here is economic and political.

The problems are primarily economic (a dead horse that I won't beat further) and technological. Satellites don't bolt to a Rokot or Proton upper stage the same way they do to an Ariane. The environmental specs are different, and the satellite must pass the tests before the Russians (or anybody else) will launch it. I wouldn't bet on the power feed from the booster even being the same voltage...Larson & Wertz list 12 parameters in the booster ascent environment alone (table 18-7).

The timeline bothers me - a Russian launch would require building a relationship with the appropriate agencies, identifying a cheap launch opportunity (if there is such a thing in Boris Yeltsin's Russia), reengineering P3D to fit the available booster, paying for said reengineering, finding yet more money for launch fees (above what we've already paid ESA). Etc. etc. etc. As opposed to working with ESA, with whom AMSAT already has an established relationship, with a satellite designed for an Ariane launch, ready to bolt onto the rocket and go...the only real problem remains sorting out the logistics.

It sounded distorted / warbley to me also on 5/17. But what was strange
about it was that a strong SSB signal up the band sounded like that but my
own downlink (CW) sounded fine. Last night (5/18) everything sounded fine
again and I made one SSB and one CW QSO.

I certainly hope we don't lose RS12. There are not too many easy-sats left.

Well, I recently got a wake up call. Tuesday night I was arrested in Newington CT outside of the ARRL headquarters. Apparently, I was almost naked and assaulted David Sumner as he left work for the day. I say apparently because I was very, very drunk and remember nothing but throwing my clothes out the window on I-95. In addition to assault and indecent exposure, I face DUI charges and illegal possession of a firearm. God only knows what I intended to do, but there was a pawnshop receipt from a Boston area pawnshop, and a box of rifle shells. I want to thank all you guys for not letting me get by with my trolling and relentless ham bashing. I realize now that I have led a frustrating, boring life, and with the help of the treatment program my school's EAP has sent me to, I hope to pick up the pieces of my life someday. It all went wrong after high school, when I was no longer president of the ham radio club at South Dennis High, and couldn't really cut it in college. Ham radio was my life, I had no balance, so eventually, when I realized how empty my life had become, I lashed out. I am truly sorry if I have caused anyone here any pain or anger.

Burt

Okay now Burt, repeat after me.

I am pitifully sorry, and I see the error in my ways. I am now and
forever indebted to the NRA and those modern day patriots that who
seek to keep my Second Amendment Rights strong.

de W4ABC

"The Second Amendment, really should be the first,
in that it is the one that protects all the others."

Charleton Heston - Vice President NRA

I haven't heard it sound that way lately. Maybe someone using it at the
time was severely overloading it with too much power?

Sigh, this all sucks. Maybe we could start whining about the space
station too. That's always good for a bit.

Gawd, isn't there someone out there who could cancel all the
cross-posted junk in here? I don't think there's ever been a case
where a cross-posted message had any useful content. Quality of
the message is inversely proportional to the number of groups
it's posted to, in my humble opinion.

The same thing happened a few weeks ago. I was told by a reliable source that this happens when the bird is being actively used for one of its non-ham functions. As you may know, RS-12/13 is riding piggyback on a Russian satellite which is used for other-than-amateur purposes.

RS-12 is a fun bird to work.

What others tell me:

Hello Burt,
It is rather tragic to see the juvinile garbage coming from the USA in many area of Internet, including the amateur sections. Reading the comments from various so-called amateurs on the amateur newsnet leaves oh so much to be desired. The garbage is all and only from the US. I just picked out you by chance to reply. I would like to inform you and all your tunnel-vision US amateurs that a greater percentage of "hams" around the world work "barefoot" - 100 watts and quite often with not much more than a dipole and/or long wire.

...Calling CQ-DX is quite common on all international HF bands. It is quite possible because of all the drivel eminating on the "ham" bands in the US, you may rarely get to hear the rest of the international amateur fraternity. Perhaps - and I would be surprised if what I am to say were not true - too many American Amateurs treat the radio hobby as CBers treat and violate the CB bands....!

It is indeed unfortunate in that too many of your compatriots fail to grasp the fact that the whole world sees (Internet) and hears (amateur radio) so much drivel originating from the USA. While there are many good and highly skilled amateurs in the US, there would appear to be a majority who are nothing much better than the worst type of CB operator. During the Second World war there was a well known saying...."When the British were bombing the Germans ducked for cover. When the Americans bombed everyone but the Germans ducked." It would seem that saying still applies today. When US operators are on the Net the rest of the world turns off. And when you are on the Amateur Bands.....! Need I say more! You have my full permission to insert all my comments on the BBS Nets used by yourself and other US amateurs.

Pierre,

The 2m voice frequency is 145.800 (down) and 145.200 (up) (+- 5KHz
dopplar shift).

You might also try 145.985 or 145.550, but I'm not sure...

It appears to be only effecting the 145 mhz uplink, the beacon and the 20m operators sound fine...

Hopefully it will go away soon and we can get back on. I personally won't attempt the 2m uplink until it clears, it probably makes the 20 m uplink users crazy.

Any news on RS-16?-17? Heard they were trying to get it turned on.

Does anyone know whether it is possible to control a Yaesu G-250 rotator
from a PC? I know that it is not Yaesu's most sophisticated rotator, but is
PC control of azimuth from a program like WiSP a possibility?

TIA

Nigel GJ7LJJ

Yes, if the rotor has analog position feedback (which I assume it does...). If
you can get your hands on a copy of the ARRL Handbook, it has a circuit for
controlling most rotors via the Kansas City Tracker (or at least the mid to
late 80's copies do...) QST also ran a series of articles within the last few
years or so on computer controlling rotors.

I am considering to acquire a new transceiver for satellite communications.
Does any body has comments regarding how the FT736, FT847 or IC821H perform
in satellite communications?
Waht is the difference between the IC820H and the IC821H?

Thanks

No, you are just unwilling to pull your head out of your ass and deal with reality.

The Ariane 503 launch is only about 5 months away tops, and they haven't announced who is going to ride yet? Space officials in Germany, when asked when the launch would be said they're waiting on a commercial payload.

You want to read about Phase 3d on go-ariane? Go to their search page and type 'AMSAT'.

So you say we'll ride on an ariane 4 launcher then. All Amsats planning and hope has been for an ariane 5 launch. An ariane 5 launch is best for the satellite and best for Amsat.

Mr Cold Shower

You don't need to be abusive.

The reality is that we are flying standby, on a space-
available basis, because that is all we can afford. If
you have a few million dollars to kick in to change this,
please do so.

Nothing has been decided either way.

Good for standing up and saying so!!
It is my understanding that P3D will ride piggyback on top of a commercial satellite? If there is no commercial satellite there will be no launch for us to ride on. P3D does NOT ride all by itself, no one will give us that kind of a free ride.

Exactly. Launchers are designed to launch multiple satellites,
since economies of scale make a big rocket with multiple satellites
more cost-effective than a bunch of little rockets with one
satellite each. Excess payload capacity (much easier to design
in from the start than to add later) opens the door for cheap
launches for poor folk like us. At least until the commercial folk
start designing satellites to take advantage of said excess
capacity... :-(

This is why I'm dubious about amateur launches by vehicles like
Pegasus (which *is* way-cool - just not for us), since they only
launch one satellite at a time. Their sponsors must therefore pay
for the entire operation.

The fact that multiple satellites are involved makes our situation
ticklish, since if our satellite messes up the launch, it could
take other (expensive) satellites with it. That ESA will talk to
us at all says something about how good our relationship is, and what
they think of our ability to build satellites,

As for P3D's arrangements, have a look at the diagrams - the SBS
(Specific Bearing Structure - our idea) is the cylindrical spacer
between the upper Ariane stage and the other payloads. Phase 3D
will ride inside. Other satellites will ride on top.

I guess AMSAT should have given some money to Clinton like the Red Chinese military is alleged to have done. In return Clinton is giving them the technology to launch missiles at the USA. maybe we could have gotton P3D to ride on one of the new "Clinton" missiles (bombs)?

Our being able to sit on top the SBS with a commercial sat payload depends upon the weight of that commercial payload. Does anyone here know the technical details of the purported commercial payload, and what the Ariane 5 weight capability to circular 2500 mi orbit are?

Current speculation seems to be that ESA wants to launch Ariane 503 around the end of Sept. if they can lock in their commercial payload. I've got all my fingers and toes crossed.

Araine 5's builders don't quote mass capability to such orbits, but
you could infer it from the numbers they quote. One place to start
is CNES's Ariane 5 page, at

http://www.cnes.fr/Access_Espace/Lanceurs_Ar5.html

Oh please, who is bashing who....Amateur???? By what track record?
Pleeezzzze......

I am not bashing ESA, just saying we are getting what we paid for. I sorry if Delta's, Titan's and Soviet Block Boosters have a great track record. I was really hoping for a low cost Soviet boost, but because of a trade agreement, this cannot be realized.

Unless Amsat can come up with some SERIOUS capital, I do not see allot of options. BUT if we had the capital, an Ariane 5 should be a last choice given the track record. Maybe a Ariane 4 if you wanted to stay with the ESA.

In words of one syllable or less: launches of amateur payloads by
Pegasus launch vehicles. The Orbital Sciences folks are doing some
very clever things...

> I am not bashing ESA, just saying we are getting what we paid for. I sorry
> if Delta's, Titan's and Soviet Block Boosters have a great track record. I

They have good launch records. Therefore their operators can charge
(lots) for launches. Therefore we can't afford them. If we didn't have
a good relationship with ESA we couldn't afford them, either.

> Christopher "Wondering STILL how much was given to ESA and how much Amsat
> is willing/capable of spending" Cox

What would you do with the information? What difference would it
make? The money to ESA is *paid*, and is non-refundable. As for
AMSAT's financial status, the AMSAT Journal carries regular
updates. If you really want information, sit in on a BoD meeting.
I did in Toronto last year, and found it vastly illuminating.

More to the point, anybody can ask questions and make snide comments
about AMSAT's benefactors (look at the title of this thread, for
example). Can you actually do anything about it? Are you prepared
to? How much (not just money) have you contributed to Phase 3D?
What is the title of your paper in Vicksburg this fall?

What? You mean you're not presenting? Why?

Well, we were very close to riding as the only real payload on 502.
The only thing that stopped that (in my understanding) was that vibration
spec change problem.

SkyQuest 2 Radiosonde

A ham radio equipped weather balloon will be launched between
1:00 and 1:30 PM EDT (nominal 1:15 PM), unless adverse weather
interferes, from the upcoming National Weather Service Open House
on May 30 in Taunton, Massachusetts (southwest of Boston). In case
of a postponement, we'll try Sunday, May 31. Sponsored by the
Plymouth Community Intermediate School, Roger Perry, earth science
teacher. Additional assistance from the NWS.

The SkyQuest hamradiosonde can be heard on home scanner radios and
VHF ham radios on the 2 meter band at 145.61 MHz FM. It should
be *real* easy to hear all over eastern Massachusetts, Rhode Island,
southern New Hampshire, and northeastern Connecticut. After gaining
some substantial height I hope amateur radio operators with more
sensitive receivers will be able to hear the radiosonde from as far
away as southern Connecticut, New York, New Jersey, Vermont, northern
New Hampshire, and Maine. Maybe even parts of eastern Canada at peak
altitude.

HF net control starting 1:00 PM Saturday on 3.860 MHZ from
1.5 kilowatt W1AW in Newington, CT.

Two temperature channels (inside and out) and altitude will be
measured continuously by means of audio tones. Going up and down
in frequency as the transmitter switches among the three channels,
the tones will be heard for the duration of the flight.

Some basic information is available at the North American
balloon launch website (listed below), but a better way to keep up
with developments (exact launch time, weather forecast, expected flight
track, reception tips, etc.) is to email me with a request to be added
to the SkyQuest email list.

Right. But when there would have been enough time, it would have been
the only real payload. The other payloads were dummies.

Dummies in the wrong orbit. Does P3D have enough fuel that if this happens again can it be put into a useful orbit? I know it carries quite a bit, and hearing about the latest salvage of a com satellite by winging it around the moon is sort of inspiring.

Source record: 16182

Well, since no one responded to the previous inquiry, here I go.

I am new to working SATs, but previously owned a FT736R, and latter purchased the FT847. The 736 had a problem with SSB being sort of garbled when listening to extremely low signal levels, a problem that a Yeasu Tech said he knew of and has a fix for. Both radios have a problem with their CAT interface in that the computer cannot inquire as to the freq. that is presently dialed in. I have heard that some people do not like the small speaker, and there needs to be a in between tune rate for Doppler shift correction, its either way to fast or way to slow.

Other that THE RADIO IS GREAT!!!!....:-)

I have worked both RS birds, both Fugi's, and AO-27 using turnstiles in the attic on the up and down links. This is the first radio available that I know of that you can do this out of the box. The noise floor is deep in the floor..:-)...Yet the receiver is still very sensitive. As a H.F. rig, it excels there as well with a DSP with deep skirts for CW work, heck you can even hear the CW signals in the 40 meter novice band!

This is a great radio for the money...Kudo's to Yaesu for this fine rig.

Hi Vince,

I read about their unfortunate incident a couple of days ago. Radio Dampening wall spontaneously combusting? What happened there? Anyhow I to thought that this might open up a slot, but I just felt for them.

Well, we might get a one in a life time ride after all!

>
But 502 had problems too ... engines shut down way too early and too
low for where we needed to be. It would have cut the usefull life of
P3D down 20-40%.

I do not understand this. P3D is designed to ride with a commercial satellite. No commercial and then no P3D as I understand it. The rocket will not launch with just P3D on it. It will have to wait for another commercial satellite to piggyback on.

Where does everyone get the idea that this would be good for us? Bad
as far as I know, another delay until a commercial satellite can be
found for us to piggyback on.
I do not believe that 503 would be wasted to give us and only us a
ride for free. Now 503 must search for another commercial satellite
before we get our free piggyback ride to orbit.

The upper passenger of Ariane 503 is ESA's ARD (Atmospheric Reentry Demonstrator). If Arianespace can't find a commercial payload for 503 for a launch in 1998, it may be possible that ESA decides to fly ARD without a commercial payload. This would advance the launch date ARD and Ariane 503 and, after a successful 503, Arianespace will have less problems to find a paying customer for fourth flight of Ariane 5.

In this case, P3D could be used as the lower passenger on 503.

Hello all,

What is the current condition of RS-12?
I listened this am for the 08:20 local pass
(59 degrees here in FN54)
But heard nothing.
No beacon or Qso's.. I am sure that I would have heard something!

Any ideas folks?

Jason n1rwy

My hotmail address is as legit as any hotmail address ever
is :-) (I just checked, and had 27 messages waiting). But
hotmail is sometimes flaky. Sorry.

Believe it or not, Christopher, I'm on your side. The amateur
satellite program needs new blood and new ideas. Desperately.
But it needs people who will actually *do* things, not just
talk about them.

If you are a doer, and not just a talker, please accept
my apologies.

As for the Phase 3D news on go-ariane - YAHOO!!!
Fingers crossed...

As far as I have understood the matter, P3D has been designed as a
"middle passenger" for Ariane 5. So, even if there are two paying
customers, there is still space for P3D.
If it can be launched is dependent on the size and weight of
the other two payloads, the desired orbit, etc.

I was not talking about the success of the launch, but about the
possibility of P3D going up as the only real payload (as opposed to
pure telemetry packages like those on 502 or the re-entry demonstrator
that will be on 503).
People were questioning the idea that an Ariane 5 would be launched
"with only P3D and no other paying customer". That would have happened
on 502 when there was no revised vibration spec.

There are three (3) spots open on the AMSAT Board this year.
I am interested in running for one of the spots. It takes 5 AMSAT
members to nominate someone for a board seat.

1277. MIR "Busy" good enough for Field Day?

Newsgroup: rec.radio.amateur.space

Just curious...

For Field Day, is getting a "busy" from the Mir BBS considered having made a 2-way QSO via satellite? Technically, you have contacted the space station, and it correctly heard your call, and gave you a response, which you also heard correctly.

Close enough?

Thanks,

Greg.

Greg -

Uhhh... I don't think so. A valid FD QSO includes complete exchange and
acknowledgment of the FD message - call, class and section. I suspect
that you will not get class & section from a busy signal... unless the folks
on MIR make a few changes.

3's - Glenn

MONDAY MAY 25, 1998

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* ARRL SEEKING 70-CM BAND COMMENTS *
====================================
Tom O'Hara, W6ORG, ARRL Technical Advisor for Spectrum Management and ATV,
reports that the American Radio Relay League is seeking input from users of
the 420-430 MHz segment of the 70-cm band as to the monetary loss to hams
if the band segment were taken away and given to Private Mobile Radio
Services as per LMCC's RM-9267. The total monetary amount will be
included in the ARRL's filing with the FCC. Your monetary loss should
be part of your personal filing as well.

The ARRL can estimate the monetary amount based on the number of FM voice
repeaters listed in the repeater directory for the 440-450 MHz segment
of the band. However, not all repeater links, simplex systems, or
uncoordinated repeater systems occupying the 420-430 MHz band segment
appear in the ARRL's records to allow an accurate estimate of band usage.
Amateur Television (ATV) communications is generally popular in the lower
portion of the 70-cm band, and should be well represented in comments
filed with both the ARRL and FCC.

Estimates of how much captial equipment is used for radio communications in
the 70-cm band should be directed to Jay Mabey (jmabey@arrl.org) at the ARRL.
Include your callsign and frequencies/modes used in the lower portion of
the 70-cm band.

REMEMBER: Filing comments in support of maintaining our frequency allocations
is a small price to pay for the free use of RF spectrum that is worth many
millions of dollars in the commercial world. While commercial interests
will argue about how much revenue is to be made if amateur radio spectrum
is turned over for their use, the truth is that a great deal of public money
(from Colleges, Universities, local offices of emergency management, etc.)
is already heavily invested in communication systems (such as repeater
systems and amateur radio communication satellites) that currently make

extensive use of the 70-cm amateur radio band. Not only amateur radio operators, but the general public at large may very well stand to lose more than they could possibly ever gain by a take-over of amateur radio frequencies for commercial use because of this fact.

Comments regarding RM-9267 and the proposed commercial take-over of the 420-450 MHz amateur 70-cm band should be directed to the Federal Communications Commission by 1998-Jun-01 at the following address:

RM-9267
Secretary
Federal Communications Commission
1919 M St., NW
Washington, DC 20554

* 70-CM PROBLEMS IN GUATEMALA CONTINUE *

The following is a press release issued in May 1998 by the Club de Radioaficionados de Guatemala (CRAG), the Amateur Radio Club of Guatemala, regarding the auctioning of frequencies in the amateur radio 70-cm band to commercial interests in the country of Guatemala.

"In 1996, the Congress of the Republic of Guatemala passed a new Telecommunications Law, eliminating about 40% of the amateur radio frequencies assigned internationally by the ITU for the use of amateur radio, among them the UHF band 430-440 MHz and SHF bands, with the purpose of selling these frequencies for commercial use.

These bands are used internationally by amateur radio operators for local communications and the Amateur Radio Satellite Service. In February of this year, the telecommunications authority (SIT, Superintendencia de Telecommunicaciones) already auctioned off four frequencies in the UHF band to businesses in Guatemala. The telecommunications authority has received more commercial requests for frequency assignments in the UHF band, and will auction more frequencies is this range.

The fact that the telecommunications authority accepted requests for the former UHF amateur radio band and has already sold frequencies in this range shows that the telecommunications authority disregards objections of the Amateur Radio Club of Guatemala, which argues that these frequencies should be reserved for the use of amateur radio, according to the worldwide frequency assignment by the ITU. The Amateur Radio Club of Guatemala has already presented a formal request to the Ministry of Communications to transform the UHF band 430-440 MHz back to use for amateur radio.

As it is well known, radio waves do not stop at the state boundaries, and so Guatemala will cause interference to its neighboring countries Mexico, Belise, Honduras and El Salvador, and other countries as well depending on propagation conditions. A commercial communication service is incompatible with the Amateur Radio Service, the four businesses who acquired frequencies in the UHF amateur radio segment will cause interference to the Amateur Radio Service in the neighboring countries of Guatemala and very likely also receive

interference from the exterior.

On many occasions the Amateur Radio Club of Guatemala made the telecommunications authority (SIT) aware of these problems, however to date, the telecommunications authority (SIT) has ignored all recommendations and petitions from the Amateur Radio Club of Guatemala, we have received not one reply in response to our concerns. Recently the telecommunications authority accepted a request for a frequency, which is in the segment of the Amateur Radio Satellite Service, used for satellite-ground and ground-satellite links. For those not familiar with these matters, a satellite operates very much like a ground based repeater, listens to the signals on its input frequencies and retransmits them on other frequencies, with an enormous area of coverage. Using satellites, amateur radio operators can communicate with hand held UHF radios between different countries and even different continents.

In case to authorize commercial stations in the segment of the Amateur Radio Satellite Service one will be able to hear the commercial conversations in all countries in North and South America, as well as in Europe and Asia. One does not need a lot of fantasy to imagine what kind of opinion will be formed in the affected countries about the interference caused by radio stations from Guatemala.

The Amateur Radio Club of Guatemala (CRAG) recently awarded with the Order of the Quetzal for serving 50 years the Guatemalan community, legal representative of the International Federation of Radio Amateurs (IARU) before the government of Guatemala, notices with great preoccupation how the Guatemalan telecommunications authority neglects what will inevitably affect its international relations, by deliberately causing interference to the Amateur Radio Satellite Service.

As the government of Guatemala does not allow its amateur radio operators to operate on UHF and SHF frequencies, it excludes its amateur radio operators to participate in future satellite communications, as will be the case with the International Space Station ALPHA, which will have from the beginning amateur radio equipment on board, as do already nowadays the Shuttle (NASA) and the Russian space station MIR. By suppressing the UHF amateur radio frequencies the government of Guatemala also discards its beneficial use for thousands of Guatemalans in case of natural disasters and emergencies, as has often been the case in the past.

The Amateur Radio Club of Guatemala by this means makes a call to the public conscience to prevent a future damage to the image of Guatemala abroad, which unfortunately is very likely to happen due to the inflexibility and negligence of its public administration and confirms its position to reinstall the UHF and SHF amateur radio bands in accordance with the international regulations (ITU) in this matter."

[Info via Dr. Manfred Kolbe, TG9IKE]

* KITSAT-OSCAR-25 NEWS *
==========

KITSAT-OSCAR-25 has been unresponsive to uplink signals on 145.980 MHz
since 1998-May-17. No official word from spacecraft controllers has
yet been received that might explain the problem with the satellite.

SpaceNews
=========

MONDAY JUNE 1, 1998

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* KITSAT-OSCAR-25 NEWS *
========================
The problem with KITSAT-OSCAR-25's uplink receiver appears to have been
resolved. The satellite became unresponsive to user uplink signals
on 1998-May-17. On 1998-May-28, the satellite was not only responding
to user uplink signals, but was responding on BOTH uplinks (145.870 and
145.980 MHz). Directory listings show that the satellite activity logs,
LEED surveys, and EIS (Earth Imaging System) data collections started
up again on 1998-May-25, just three days before the satellite became
available again for general use.

* FUJI-OSCAR-29 NEWS *
======================
On 1998-Jun-01, the FUJI-OSCAR-29 command station released a new status
report regarding the FO-29 satellite. The satellite has been in analog
transponder mode (Mode JA) for some time, and recent solar activity has
induced frequent 2-bit memory errors in the spacecraft's on-board
computer, hampering efforts to upload new software and causing system
malfunctions. The satellite will remain in Mode JA for a while longer
while the 2-bit memory error investigations continue.

The FO-29 command station welcomes reports from radio amateurs who
can confirm that the value of channel '2A' in CW telemetry transmissions
has changed. The value of channel '2A' is transmitted as the 6th item
after 'HI HI'. The value is normally '00'. Reports should be sent to
FO-29 commanders at: lab@jarl.or.jp

[Info via Kazu Sakamoto, JJ1WTK]

* AMSAT-OSCAR-10 NEWS *
======================
Stacey Mills, W4SM, reports tha AO-10 downlink signals have improved

considerably in the last two weeks. QSO's are now taking place again via the satellite and the solar illumination should continue to improve. Stacey had no problem hearing his own downlink at 30,000 km distance. This bodes well for this year's field day activities on AO-10. The satellite will also be orbitally well positioned for field day use this year.

The low point of this illumination cycle appears to have been around 1998-Apr-24, although the beacon could still be barely heard with deep QSB at that time. Stacey has revised his estimated ALON/ALAT to be approximately 100/25 based on these observations. A bit more information is available at:

http://www.cstone.net/~w4sm/AO-10.html

Further updates to the Web page will take place in the next few days as time permits.

[Info via Stacey Mills, W4SM]

* AMRAD-OSCAR-27 NEWS *
==========
AMRAD-OSCAR-27 spacecraft controller Michael Wyrick, N4USI, reports that AO-27 TEPR States:

On 1998-May-02, AO-27's TEPR states were set as follows:

4 = 36 = 18 Minutes
5 = 72 = 36 Minutes

This means AO-27's TX turns on 18 minutes after entering sunlight and stays on for 18 Minutes. AO-27's TX is turned off at all other times during the orbit.

Remember, this happens every orbit, 14.2 times a day, around the globe. This will cause the satellite to be on during the daytime at Northern latitudes.

[Info via Michael Wyrick, N4USI]

* MESSAGE FROM ANDY THOMAS *
==========
Andy Thomas, the American astronaut working on the space station Mir posted the following message to the Mir packet radio personal message system on 1998-May-24 for all radio amateurs:

SUBJECT: THANKS/BYE

I AM ABOUT TO END MY TIME ON MIR AND I WANT TO THANK ALL THE HAM OPERATORS AROUND THE WORLD WHO HAVE SENT MESSAGES. I HOPE IT IS UNDERSTOOD THAT THE VOLUME OF TRAFFIC HAS MADE INDIVIDUAL RESPONSES IMPOSSIBLE BUT WE REALLY ENJOY YOU MAIL. VOICE HAS BEEN VERY DIFFICULT PARTICULARLY OVER THE US AND EUROPE. TOO MANY TALKING AT ONCE. IN THE SHORT TIME I HAVE LEFT I WILL TRY TO DO VOICE, BUT ASK THAT REPEAT CALLERS STAY OFF THE AIR SO THAT I CAN

GIVE NEW CALLERS A CHANCE FOR A CONTACT. BEST WISHES TO ALL OF YOU.

ANDY THOMAS

P.S. REMEMBER, FOR QSL, CONTACT DAVE LARSEN ON N6CO IN CALIFORNIA.

* IRIDIUM SATELLITE NEWS *
==========
Motorola's Iridium satellites have become popular spacecraft to watch streak across the night sky due the brief and predictable -8 magnitude "flare" that can be seen when sun angles are just right. The "flare" occurs when an antenna on one of the satellites aligns correctly between your location and the sun.

Stephen Daniels explains that several Internet Web pages have been developed for those interested in Iridium flares. One such page is located at:

http://www.satellite.eu.org/sat/vsohp/iridium.html

while information on general satellite observation is available at:

http://www.satellite.eu.org/sat/vsohp/satintro.html

Iridium flare prediction software is also available at the URL listed above.

Keplerian orbital data may be found at:

http:// www.wingar.demon.co.uk/satevo/index.htm

while online predictions are available at:

http://www.gsoc.dlr.de/satvis/

Further information and discussions relating to visually observing satellites may be found on the Usenet newsgroup sci.astro.satellite.visual-observe.

Information on a listserver for observations and general mail about visible satellites may be found at:

http://www.satellite.eu.org/sat/seesat/seesatindex.html

Help me.
I can purchase transceiver IC-820.
I want it(him) to have for QSO through the satellites.
I know, that IC-821 the excellent apparatus for QSO through the satellites.
Tell, which differences has IC-820 from IC-821.
Thank!

1296. 1st Straw Poll: rec.radio.amateur.* reorg

Newsgroup: rec.radio.amateur.space
Date: 1998-06-04 00:00:00 UTC
From: Jeremy Billones <voting@clark.net>
Message-ID: <6l6jci$8q7$1@clarknet.clark.net>
Source record: 16124
Cross-posted to: rec.radio.amateur.space,rec.radio.noncomm,rec.radio.scanner,rec.radio.shortwave,rec.radio.swap

FIRST CALL FOR VOTES (of 2)

Votes must be received by 23:59:59 UTC, 22 Jun 1998.

This vote is being conducted by a neutral third party. Questions
about the straw poll should be directed to the rec.radio.amateur.*
Working Group at <rra-wg@theporch.com>

Votetaker: Jeremy Billones <billones@primenet.com>

STRAW POLL Q & A

Q: Who is doing this?
Q: How may I join the rra-wg?
Q: Why are we doing this?
Q: What are we doing?
Q: More to the point, why are we "kicking over this hornet's nest?"
Q: Why do you want to change the newsgroups again?
Q: Who are you to tell us what to do with "our" newsgroup?
Q: How long ago were each of the rec.radio.amateur.* newsgroups created?
Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and
rec.radio.swap included in this opinion poll?
Q: Where can I obtain a copy of the original newsgroup charters?
Q: Where can I find out more information about the Usenet RFD/CFV
process?
Q: I don't want any of the newsgroups to change. What should I do?
Q: I want to go back to one single newsgroup for amateur radio on
Usenet, like we had back in the 1980's. What should I do?
Q: I support some of the newsgroups for amateur radio, but not others.
What should I do?
Q: I support the existence of a newsgroup, but disagree with its
charter. How should I vote?
Q: I would like new newsgroups to be created, what should I do?
Q: I have no opinion, what should I do?

Q: Who is doing this?

The rec.radio.amateur.* Working Group (rra-wg@theporch.com, which
initiated the last major reorganization in 1993) is the point-of-contact
for questions about this opinion poll. Principal members are Paul
W. Schleck, K3FU, and Jeffrey Herman, KH2PZ. Though not an rra-wg
member, Gary Coffman, KE4ZV, also endorses this opinion poll. this
opinion poll will be conducted by an unbiased third party from the
Usenet Volunteer Votetakers (UVV), Jeremy Billones
(billones@primenet.com).

Q: How may I join the rra-wg?

Anyone who volunteers may join the rra-wg. The rra-wg has always solicited volunteers from when it was created in 1993 (originally named rra-reorg) to draft an RFD to reorganize the rec.radio.amateur.* newsgroups (and continues to serve as an advisory group for FAQ maintainers and new newsgroup proponents). You may join the rra-wg by subscribing to its mailing list.

The automated list manager address is

listproc@theporch.com

Use this for subscribing, unsubscribing, getting archived info, getting the FAQ message, changing your address, etc.

To subscribe, send a message to this address with "subscribe rra-wg <your name>" Similarly, to unsubscribe, replace "subscribe" with "unsubscribe"

The list owner address is

listown@jackatak.theporch.com

Use this address only when there is a problem which really truly can't be resolved otherwise.

Q: Why are we doing this?

Discussion on the rec.radio.amateur.* newsgroups shows that there is a difference of opinion about the current newsgroups and their charters. Assertions on one side of the argument that the charters were voted upon by the readers have been countered with assertions on the other side that the votes took place years ago, by a very small minority of the current readership. There is also the strongly-held opinion among some that we have "too many newsgroups." The following is a sample posting from the discussion thread on rec.radio.amateur.misc that led to this opinion poll (the entire thread may be viewed at DejaNews, http://www.dejanews.com/):

Q: What are we doing?

As a preliminary (and perhaps even diverting) step to an RFD (which would be very laborious and time-consuming, and perhaps unnecessary), we will conduct a Straw Poll, or "Vote of Confidence" (similar to the vote of confidence for a Prime Minister made by British Parliament, or a non-binding resolution of the U.S. Congress). We do it Usenet-vote style (utilizing a neutral vote-taker from the UVV). During the poll, a vote is taken where a "Vote of Confidence" yeah or nay for each newsgroup, as currently constituted and chartered, is given by each voter (YES/NO/CANCEL/ABSTAIN votes are valid).

What votes mean:

YES: I support the existence of this newsgroup and its charter

NO: I disagree with this newsgroup's charter or I believe that this newsgroup's existence should be reconsidered in a future RFD/CFV

CANCEL: Delete any previous votes I made concerning this newsgroup

ABSTAIN: I have no opinion concerning this newsgroup

Each newsgroup that does not pass a vote of confidence by Usenet voting standards (2/3 and 100 vote majority of YES versus NO votes) may be referred to the Usenet newsgroup creation process where their deletion or modification (based on a rough consensus of the preceding 30 days of discussion and how much they lost in the vote of confidence) is proposed. Each newsgroup that does pass a vote of confidence will have its charter, and justification for existence, reinforced to the readership (as the current readership voted on it).

Q: More to the point, why are we "kicking over this hornet's nest?"

Sometimes hornet's nests can get big enough that they wind up falling down anyway. As shown in the thread above, there are significant undercurrents of disagreement over the current newsgroups, their charters, and even the suggested guidelines and rules of net-etiquette that many on the newsgroups advocate. If this opinion poll shows strong agreement with current practices, then that would help reduce (though not eliminate) newsgroup arguments on the subject. If, however, this opinion poll shows strong disagreement, then it's probably better that we know that right away, and take steps to fix the current situation before it degrades any further.

Q: Why do you want to change the newsgroups again?

Only some of the proponents of this opinion poll wish to change the newsgroups. Some wish to simply have the current newsgroups and their charters reinforced. All of the proponents agree that an up-to-date opinion poll of the readership is desirable at this time. Whatever future actions will be taken will be determined by the results of this opinion poll.

Q: Who are you to tell us what to do with "our" newsgroup?

One answer is that on Usenet, no one "owns" an unmoderated newsgroup. Newsgroups are voted into existence by a democratic process to determine consensus (and lack of significant objection) for using shared network resources to support them. All of the existing rec.radio.amateur.* newsgroups passed such a vote at some time in the past, and should pass such a vote again if there is strong support for their continued existence.

Another answer is that this is just a non-binding opinion poll of the readership to determine a consensus, if any, for making changes. It would still be necessary to undertake a formal RFD/CFV process to change any Usenet newsgroup (and that was always possible, anyway).

It should also be emphasized here that no individual rec.radio.amateur.* newsgroup is being singled out. Rather, a consensus of the readership concerning ALL rec.radio.amateur.* newsgroups is being sought.

Q: How long ago were each of the rec.radio.amateur.* newsgroups created?

1972 (or possibly earlier, this date is when UCSD joined the ARPANet):

Info-Hams (original ARPANet mailing list at Simtel-20, continues today at UCSD as a gateway of rec.radio.amateur.misc)

1979:

Creation of Usenet News at Duke and UNC

early 1980's:

fa.info-hams (fa = "From ARPANet") *
net.ham-radio (pre-Kent Paul Dolan "Great Renaming") *

mid 1980's-1991:

rec.ham-radio *
rec.ham-radio.packet *
rec.ham-radio.swap *

1991 Reorganization:

rec.radio.amateur.misc
rec.radio.amateur.packet *
rec.radio.amateur.policy
rec.radio.cb
rec.radio.swap

1992/3 Addition:

rec.radio.info

1993 Reorganization:

rec.radio.amateur.antenna
rec.radio.amateur.digital.misc
rec.radio.amateur.equipment
rec.radio.amateur.homebrew
rec.radio.amateur.misc
rec.radio.amateur.policy
rec.radio.amateur.space

1996 Additions:

rec.radio.amateur.dx
rec.radio.amateur.boatanchors

* = obsolete

Current newsgroups covered by this opinion poll, and the years
in which they were created:

rec.radio.amateur.antenna (1993)
rec.radio.amateur.boatanchors (1996)
rec.radio.amateur.digital.misc (1993)
rec.radio.amateur.dx (1996)
rec.radio.amateur.equipment (1993)
rec.radio.amateur.homebrew (1993)
rec.radio.amateur.misc (1991)
rec.radio.amateur.policy (1991)
rec.radio.amateur.space (1993)
rec.radio.info (1992/3)
rec.radio.swap (1991)

Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and
rec.radio.swap included in this opinion poll?

Though one level up in the rec.* hierarchy, these newsgroups are
principally used by readers of rec.radio.amateur.*, and their fates
would substantially be decided by any significant reorganization of the
rec.radio.amateur.* newsgroups. Though created by a rec.radio.amateur.*

reorganization, rec.radio.cb is not included in this opinion poll.

This announcement has been cross-posted to all rec.radio.* newsgroups (except for rec.radio.broadcasting and rec.radio.info, which are moderated). In addition, the following individuals were consulted prior to this announcement (note that consultation does not necessarily imply endorsement):

Richard Eckman, KO4MR, Proponent of rec.radio.amateur.dx
Brian Kantor, WB6CYT, Administrator of Info-Hams/Ham-* mailing list gateways of rec.radio.amateur.* newsgroups at UCSD
Ian Kluft, KO6YQ, Proponent of 1993 rec.radio.amateur.* reorganization, former rec.radio.amateur.* FAQ Maintainer
Jay Maynard, K5ZC, Proponent of 1991 rec.radio.amateur.* reorganization
Brian Short, K7ON, Moderator of rec.radio.info
Rick Stealey, K2XT, Proponent of rec.radio.amateur.boatanchors

Q: Where can I obtain a copy of the original newsgroup charters?

ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.info
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur-reorg
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.dx
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.boatanchors

Q: Where can I find out more information about the Usenet RFD/CFV process?

ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Create_a_New_Usenet_Newsgroup
ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Format_and_Submit_a_New_Group_Proposal
ftp://rtfm.mit.edu/pub/usenet/news.groups/Guidelines_on_Usenet_Newsgroup_Names

Q: I don't want any of the newsgroups to change. What should I do?

Vote "YES" for all of the existing rec.radio.amateur.* newsgroups.

Q: I want to go back to one single newsgroup for amateur radio on Usenet, like we had back in the 1980's. What should I do?

Vote "NO" for all (or all but one) of the newsgroups.

Q: I support some of the newsgroups for amateur radio, but not others. What should I do?

Vote "YES" for any newsgroups that you wish to remain unchanged, and vote "NO" for any newsgroup you wish to have reconsidered in a future RFD/CFV.

Q: I support the existence of a newsgroup, but disagree with its charter. How should I vote?

Since this opinion poll is for both the existence of given newsgroups AND their current charters, you should vote "NO" for that newsgroup. Again, this is a non-binding opinion poll simply to determine if current newsgroups should be considered for modification or deletion, not a vote

to actually modify or delete these newsgroups.

Q: I would like new newsgroups to be created, what should I do?

Creation of new newsgroups is not being considered by opinion poll. A future RFD/CFV would have to be initiated to do this. You are, of course, welcome to express your opinions concerning new newsgroups by posting them to rec.radio.amateur.misc (*NOT* by E-mail to the vote-taker).

Q: I have no opinion, what should I do?

You may wish to read the preceding 30 days of public discussion on rec.radio.amateur.misc about this opinion poll to develop your own opinions (go to http://www.dejanews.com/ and search for "STRAW POLL"). If, after reading the public discussion, you still remain undecided, you may abstain from this opinion poll. You may do so informally by not participating in it at all, or formally by explicitly voting "ABSTAIN" for all of the newsgroups.

IMPORTANT VOTING PROCEDURE NOTES:

Standard Guidelines for voting apply. One vote per person, one account per voter. Votes must be mailed directly from the voter to the votetaker. Anonymous, forwarded or proxy votes are not valid. Votes mailed by WWW/HTML/CGI forms are considered to be anonymous votes.

Vote counting is automated. Failure to follow these directions may mean that your vote does not get counted. If you do not receive an acknowledgment of your vote within three days contact the votetaker about the problem. It's your responsibility to make sure your vote is registered correctly. Duplicate votes are resolved in favor of the most recent valid vote. Addresses and votes of all voters will be published in the final voting results post.

HOW TO VOTE:

Extract the ballot from the CFV by deleting everything before and after the "BEGINNING OF BALLOT" and "END OF BALLOT" lines. Don't worry about the spacing of the columns or any quote characters (">") that your reply inserts. Please, DO NOT send the entire CFV back to me!

Fill in the ballot as shown below. Please provide your REAL NAME and indicate your desired vote in the appropriate locations inside the ballot.

When finished, MAIL the ballot to: < voting@clark.net >
Just "replying" to this message should work, but check the "To:" line.

Examples of how to properly indicate your vote:

[YES] example.yes.vote
[NO] example.no.vote
[ABSTAIN] example.abstention
[CANCEL] example.cancellation

DO NOT modify, alter or delete any information in this ballot!
If you do, the voting software will probably reject your ballot.

If these instructions are unclear, please consult the Introduction to
Usenet Voting or the Usenet Voting FAQ at http://www.iki.fi/~jpatokal/uvv.

======== BEGINNING OF BALLOT: Delete everything before this line =======
.---
| 1ST STRAW POLL: rec.radio.amateur.* reorg
| Official Usenet Voting Ballot <RRSP-0001> (Do not remove this line!)
|---
| Please provide your real name, or your vote may be rejected. Place
| ONLY your name (ie. do NOT include your e-mail address or any other
| information; ONLY your name) after the colon on the following line:

Voter name:

| Insert YES, NO, ABSTAIN, or CANCEL inside the brackets for each
| newsgroup listed below (do not delete the newsgroup name):

Cross-posted to: rec.radio.amateur.space,rec.radio.swap

For Sale :

"The Pacsat beginners guide"
"The Amsat-NA Digital Satellite guide"
"A beginners guide to oscar-13" (has a lot of info on equipment for other
birds)
"The RS Satellites operating guide"
"Decoding Telemetry from the Amateur Satellites"

AMSAT-NA space symposium proceedings :

1992
1993
1995
1996

(each has about 200 pages. full of good info)

I will not split this. All are in really good condition -
not ripped, not drawn in by my 3-year old !

All of this for $50 + shipping (cost about $110).

1300. Re: Yaesu FT736R or FT847 for Satelitte?

Newsgroup: rec.radio.amateur.space
Date: 1998-06-06 00:00:00 UTC
From: Christopher Cox <cobox@netexp.net>
Message-ID: <01bd918f$8e1da420$9d60b6cd@cbx-nt>
Source record: 15886

Hi Mike,

My response was in jest as well.....:-)

But seriously, why did you chose the IC821 over the FT847?

I had owned the FT736 prior to the 847, and found the 847 better at weak signal work. I was told by a Yaesu Tech that there was a mod for the 736 to fix the problem I spoke of while working weak signals.

I love this little all in one jewel, but as someone mentioned before, it does have some shortcomings.

Regards

Christopher Cox

Message-ID: <6lcjs8$7v2@bgtnsc03.worldnet.att.net>
Source record: 15887

Hi Chris,

When I ordered the IC-821 I wanted what I thought would be the very best quality satellite radio that I could purchase to use with transverters for the higher freqs that will be used by phase 3D. The FT-847 was not yet being delivered but my assumption was, and still is, that it is an excellent box for casual use on any band, and any mode but probably not the very best that is available for weak signal satellite work.

Down East Microwave, for example, is working on transverter packages for the IC-821 that are to bolt right on the back of the heat sink and use internal cabling that was placed there (inside IC-821) for that purpose. I don't think that kind of flexibility has been designed into the FT-847 but then who knows!

That was my reasoning even though it may have been flawed!

73 - Mike - K9JRI

1302. 'Easy' amateur satellites

Newsgroup: rec.radio.amateur.space
Date: 1998-06-06 00:00:00 UTC
From: Rodney Isom <rodneyi@mindspring.com>
Message-ID: <6lcs29npm1@camel25.mindspring.com>
Source record: 15888

I'm sure this question gets posted here a lot, but here goes:

I'm really new to amateur satellite operation (I've contacted MIR on packet a couple of times) and I'd like to know what other amateur satellites I can work with the equipment I've got. I have a 2-m FM transceiver and a 10-M SSB transceiver, along with a TNC and a 2-element quad antenna for 2-m. I've looked at the different satellites on 'amsat.org' but it's hard to tell sometimes if the frequencies are FM, SSB, or what. Any help will be appreciated.

1303. Yaesu FT736R or FT847 for Satelitte?

Newsgroup: rec.radio.amateur.space
Date: 1998-06-06 00:00:00 UTC
From: herbr@netcom.com
Message-ID: <herbrEu4CF9.I0u@netcom.com>
Source record: 16128

I am interested in getting on the satellites and trying to decide between the older 736R and the new FT847. I already have 3 HF radios, so I don't really need another one with that capability, but I am not sure if the 847 has other advantages over the 736 for vhf-uhf satelllite work.

I would appreciate any comments or suggestions in evaluating these two radios for the vhf-uhf satelette capabilities.

Thanks and 73.

Message-ID: <6lc0pu$eb5@bgtnsc03.worldnet.att.net>
Source record: 16132

That is quite true but HF was not a requirement of the original post as 3 HF rigs were already available. My reply was meant only to be humorous as the Icom line was not under consideration anyway. Had the field been completely open my post would have been serious as the IC-821 is probably the better VHF/UHF radio.

In any event I have used the FT-847 for a very short time and found it to be a great radio but probably not as good as an IC-821 and an IC-756 together but then the cost is much different too! You do tend to get what you pay for.

My serious response would have been that the FT-847 as it is a better value than the rather old FT-736 design. I do suspect that the actual RF part of the 736 may be better than the 847 but the features are not.

From: Johnson <Kris_Johnson@yahoo.com>
Message-ID: <01bd91b2$b7775820$db6118cb@defiant>
Source record: 15889

Hi,

I have an information page about a project called SETI@home at

<http://www.geocities.com/CapeCanaveral/Launchpad/7017/>

SETI is the Search for ExtraTerristrial Intellegence and they're starting up a distributed computing project. This means that you will be able download a screensaver that scans radio telescope data for signals of intellegent life while you're off having a coffee break (or whatever).

They're still putting it together, but if you're a programer, they could use your talent.

This is for real, and much more likely to turn up "aliens" than staking out Roswell.

On the page I've got a link to the SETI@home homepage, other SETI pages, some interesting books, and links to other distributed computing projects. For example, while I'm not doing anything with my PC, it's trying to crack an encryption competition thing...

Have fun,

Kris.

=========
SpaceNews
=========

MONDAY JUNE 8, 1998

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* APRS EXPERIMENT DAYS ON AO-16 *
================================
AMSAT-OSCAR-16 command station Jim White, WD0E, has authorized an APRS
experimenters day on AO-16 to explore the use of the 1200 baud Pacsat
for position/status reporting for distant travelers using common TNCs.
The test periods will run from 0000 to 2359 UTC on Tuesdays (Monday nite,
and Tuesday day passes). APRS experimenters are requested to uplink only
on 145.940 MHz. Normal TNCs will NOT work unless modified for Manchester
transmission (a $3 mod); see TRAKNET in the May/June issue of the AMSAT
Journal for details, assuming you do not have a 1200 baud pacsat modem.

The intent here is only to provide a channel for mobile travelers or
wilderness position/status reporting (1 or 2 packets per station per day).
Existing users of AO-16 need not fear a deluge of activity, since most
99.9% of APRS users are already connected nationwide via VHF, UHF, HF, and
Internet gateways. Comparing this 24 hour a day connectivity with the
potential of only a few packets a day via AO-16 will certainly limit
activity to only those truckers, RV'ers and cross country mobile travelers
in the wilderness, willing to make the TNC mod.

Obviously, the objective for the ultimate use of the AO-16 link is for
7 day a week use on one of its 4 uplink channels. But to TEST these
concepts, the once a week APRS test day will be used to gather data on the
optimum transmission rate and on the details of making the XOR chip mod on
a variety of TAPR-2 type TNCs. By using only one day per week now, our
experiments will be focused to when the downlink stations are active.

The number one need is for automated AO-16 downlink stations (maybe 3 to
5 across the country) who will link the APRS packets into the rest of
the terrestrial network. TELNET to 199.227.86.221 port 23 to see the
continuous stream of nationwide APRS packets. We have one volunteer
so far in Pennsylvania, NR3U. The AO-16 command team thinks that this

experiment may lead to some good developments in using DSP to automate the reception of the PSK downlink. If you have talent in this area, come join us.

The idea is to use conventional 2-meter FM mobile radios and standard TNCs with the added $3 XOR gate so that any DX mobile can configure for transmitting his position/status via AO16 a few times a day. This makes the uplink trivial to do for ANYONE going on a long trip.

If you are 1200 baud PACSAT capable, please monitor the downlink on Monday nights and Tuesday days for any UI frames and capture them. Even if you don't have a PACSAT modem, but do have UHF all mode, you should be able to hear individual digipeated packets on 437.051 MHz. AO-16 comes over everywhere in the USA between 10:30 and 1:30 both AM and PM local time.

Hopefully we will establish a mailing list of APRS-AO16 experimenters so that we can keep close tabs on the progress of the experiments. If you are not on that list, please indicate to me (wb4apr@amsat.org) your interest.

[Info via Bob, WB4APR]

* FUJI-OSCAR-29 NEWS CORRECTION *
==========
The FO-29 command station released on 1998-Jun-02 a correction to their earlier announcement regarding FO-29 which was included in last week's issue of SpaceNews. The telemetry value groundstations are asked to monitor is channel '2B', which is the 6th value from 'HI HI'.

[Info via Kazu Sakamoto, JJ1WTK]

* KITSAT-OSCAR-25 NEWS *
==========
After returning to full service last week, KITSAT-OSCAR-25 is no longer responding to upload and download requests made on either uplink frequency. The satellite continues to transmit telemetry and status information on its downlink frequency. In addition to this, the satellite is transmitting the following ASCII text packet:

HL02->NEWS <UI>:
"We will reboot the OBC S/W of KO-25 for a while."

The satellite is reporting a spacecraft kernel uptime of over 450 days.

* FEEDBACK/INPUT WELCOMED *

Hello everyone,

I copied Andy Thomas aboard the MIR. He said ''REMEMBER, FOR QSL,
CONTACT DAVE LARSEN ON N6CO IN CALIFORNIA''

Can anyone help me to N6CO's address?

Thanks!

Ary

No. A specific exchange is required for FD. Also, pinging Mir's PBBS really interferes with its real purposes -- education and crew recreation.

Radio Meteor Observation Bulletin No. 58 June 1998

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Barcelona, Spain (01 59' E, 41 21' N)
Frequency: 48.250 MHz
Transmitter location: most likely Czech television C2 C. Budejovica,
100 kW, horizontal polarisation.
Antenna: 6-element Yagi 617-6B, 14 dBd gain.
astronomical azimuth 215 deg (=NE), elevation 0 deg.
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (100 Hz) and fed into the PC in real time.
Data sampling system: using a super 14 bits A/D card to PC/XT and
"Data Capture" software with 9 second/18 sampling interval to
store all the > 1.0 s signal increases.

```

Notes:
. ? probably affected by sporadic-E, direct reception.
. @ half hour only, count doubled for the complete hour
. local time = UT + 2 hours.
. * warning for relative high number of long duration reflections,
an indication for potential stream activity.
. eta Aquarids maximum activity on May 5.

Maurice De Meyere

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 20 deg
Antenna amplifier: 10 dB gain
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

Will Kelsey

-------------------------------------------------------------------------
Observer: Werfried Kuneth
Location: Ferndorf, Austria (13 37' E, 46 45' N)
Antenna: 2 element Yagi, direction northwest, no elevation at 2 m height.
Receiver: IC-706 at 53.76065 MHz, CW-R mode, 500 Hz CW filter, fast AGC.
Transmitters: 1) 30 kW TV video carrier from Bari, Italy, distance 700 km,
direction south and 2) a 30 kW TV video carrier from Sicilia,
Italy, distance 900 km, south. The total echo power of both
transmitters is processed into same 40 Hz virtual
receiver channel.

Observing method: automatic setup using FFTDSP42t software by AF9Y to record
the audio signal. 20 channels of 2 Hz width are used for meteor
identification, pictures with interference, sporadic-E, E-layer
and FAI propagation are manually rejected. Sampling interval: one
4096 point FFT every 0.5 seconds.
```

The meteor counts below are corrected for a full hour observing time. If the recording duration is 20-40 minutes, a dot is shown after the value, to show the reduced accuracy. Results for less than 20 min. observing time are excluded.

Counts of reflections longer than 3.5 seconds:

2. ANNOUNCEMENTS

Ian Galpin (g1smd@amsat.org) received part of RMOB9804 from astronomy club member Steve Tonkin (sft@aegis1.demon.co.uk), and provided following information and comments about "2.1. The demise of the East European FM-band":

">The 66-73 MHz is not used for other purposes in Western Europe.

Don't forget also the Amateur Radio band in UK (G, GM, GW, GI, ...) at 70.000 to 70.500 MHz, and in Eire (EI) at around 70.200 also. There are some beacons on air from both countries, and some FM activity on 70.260 MHz and 70.450 MHz. There are also beacons in Gibraltar (ZB2) and Cyprus (5B4). South Africa (ZS) now has some beacons on air, with amateur activity to start in the next year. G3NKS (4news@g3nks.demon.co.uk) edits the 'Four Metres News' magazine, and can supply more information on this.

There are some 'aero' beacons on 75.000 MHz that can be monitored, though I have no more information at this time.

> Alternatives are TV stations (more difficult to identify) or beacons in
> the 50 MHz band (rather weak).

TV stations are more difficult to identify, but there are many clues. The channel E2 is at 48.25 MHz, but in fact the TV stations are not all on the exact same frequency. They are spread up to 30 kHz either side of this in steps of about 1.3 kHz (that is, in 1/12 parts of the line frequency of 15.625 kHz).

Other TV channels are at:

Chan	Video	Audio	Area
E2	48.25 MHz	53.75 MHz	West Europe
R1	49.75 MHz	56.25 MHz	East Europe
IA	53.75 MHz	59.25 MHz	Italy
EB	53.75 MHz	59.75 MHz	Eire
E3	55.25 MHz	60.75 MHz	West Europe
R2	59.25 MHz	65.75 MHz	East Europe
IB	62.25 MHz	67.75 MHz	Italy
E4	62.25 MHz	67.75 MHz	West Europe

The Eire channel EB is very good here from Southern England. There is one transmitter (video) on 53.757 MHz which is good via both MS and Aurora. There are also transmitters from Italy on 53.739 and 53.761 MHz (video) that can be heard via MS and via Es.

These frequencies are far enough apart to easily tell which transmitter is being listened to when using an SSB receiver."

Ian Galpin

3. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and it has gradually been expanded. In regularly publishing summaries of observations, potential radio observers are kept up to date of existing installations, possibilities and limitations of radio meteor observations. In the long run, there should be sufficient observing stations to cover the whole globe, allowing to detect stream outbursts which may remain unnoticed visually.

RMOB contains typically: summaries of recent observations, equipment data, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or un-subscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

1320. Lunar slingshot

Newsgroup: rec.radio.amateur.space
Date: 1998-06-09 00:00:00 UTC
From: keinanen@sci.fi
Message-ID: <3592ca75.2116305676@news.sci.fi>
Source record: 15900

In the sci.space.news newsgroup, there has been several articles about the salvage operation of the HGS-1 communication satellite, which was left on a some kind of useless orbit due to a booster failure in December. Apparently the satellite was originally in some kind of high inclination, low apogeum geosynchronous transfer orbit and that a geosynchronous orbit could not have been reached with internal fuel in the satellite.

Instead of trying to make the orbit more circular, some internal fuel was used to make the orbit more elliptical, in fact moving the apogeum to about 400000 km. The orbit was timed so that it would coincide with the Moon. The satellite made a half orbit slingshot around the Moon (in a similar orbit as the failed Apollo 13). The HGS-1 flyby corrected the high inclination problem and apparently also the low perigeum problem.

A second lunar flyby is made these days and with some internal rocket firing will bring the satellite to a geosynchronous orbit.

I do not know, how much internal fuel is consumed compared to a successful booster operation, so it is possible that the usable life time of the satellite will be greatly reduced due to shortage of station keeping fuel.

This concept of using lunar slingshots might be interesting for launching amateur satellites.

To launch a satellite to a low orbit, a booster delta-V requirement is about 8.5 km/s. To get to the 40000 km apogeum geosynchronous transfer orbit about 10.8 km/s is required (and 2-3 km/s extra is required to get to a circular geosynchronous orbit). However, the get to the lunar transfer orbit, i.e. to a highly elliptic (400 km perigeum and 400000 apogeum) only 11.2 km/s is required. This is only about 0.4 km/s more compared to the GTO orbit. The lunar slingshot could then be used to reshape the orbit. Even if a geosynchronous orbit is not attempted, this slingshot could be used to avoid the problems with low perigeum (high perigeum pass speed and atmospheric drag, which finally killed AO-13).

Such complicated maneuvers would require a restartable engine and quite stable attitude control system.

Why not leave an amateur satellite in orbit around the moon??

1322. STSPLUS

Newsgroup: rec.radio.amateur.space
Date: 1998-06-09 00:00:00 UTC
From: John Giardina <jdg66@bestweb.net>
Message-ID: <6ljhc5clc1@supernews.com>
Source record: 15902

Anyone have map level 2 & 1 for STSPLUS who is willing to share with me?

Thanks

1323. RS-12 deliberate qrm. Who is it?

Newsgroup: rec.radio.amateur.space
Date: 1998-06-09 00:00:00 UTC
From: pmarkham@mortimer.COM
Message-ID: <18430159306836@mortimer.com>
Source record: 15903

It has been close to a year since I have used RS-12 but this morning
I was moved to try a few cw qsos. My first attempt answered a cq from
AB2CJ, on an unused frequency among the ssb activity at the upper end of
the transponder? output spectrum. Pretty close to immediately, someone
else using the satellite started to transmit an unidentified carrier on the
frequency, interspersed with references, in about 8 wpm Morse code, to
"qrp". The qrm encouraged me to terminate the qso, prematurely, and seek
cw activity in the lower portion of the spectrum.

I answered a lone cq from W9DYQ and was met with the same qrm
techniques experienced during the previous qso. I reduced the output
of my transmitter, a TS-790, from 25 w cw to 10 w cw, to see if it made
a difference to the source ot the qrm. It made none; I was forced to
terminate the qso.

As soon as I had signed, through the qrm, someone else felt compelled?
to qrm the qrmer, with a continuous train of Morse dots,until the pass
was almost complete at my qth.

The original carrier/Morse qrm changed to some broad spectrum
noise duelling with the continuous train of morse dots, sliding up and
down the lower part of the spectrum. Needless to say, my fun was
destroyed, and I suspect the lack of other cw activity may be the
consequence of what appears to be the action of a satellite bully? cop?
and the, IMHO, inappropriate response of a "lurker".

Regardless of the motives, right or wrong, the effect was to turn a pleasant
experience into something entirely different, like the effect of the sand
kicking bully, at the beach.

There is a chance that someone, within the 145 Mhz terrestrial uplink
range of the "bully", may know who it is, having heard, directly, the qrm from
the 145 Mhz uplink source. If there are those that KNOW who the source of
the qrm is, but lack the courage to police their own neighbourhood, please
provide me the details.

PS. I am aware that hosing an LEO "bird" with high power is self defeating,
in many cases, for various technical reasons that others may wish to
detail. My signals are seldom a commanding presence to or from the
satellites I work because my antennas are a pair of old, phased, AOP-1
packages that can be outgunned by a single, new, computer designed yagi.
I seldom have reason to use more power than the TS-790 will provide. In
most cases I run the 790 at half power, or less, without an amp, especially
on cw, where a little does a lot.

I've made a couple of packet contacts with MIR's BBS (no real people). Does this qualify me for a QSL card? If so, I have the address -- what info do I need to send?

By the way, I made the contact with a 5W HT and a 2 element quad with very little trouble. Is this unusual or is MIR always that easy??

Thanks,

Rodney - KF4COV

Hi All,

I have just started listening to satellites and am building some equipment to get a signal up there. I have been getting good results from RS12.

What has happened to RS10/11 the kep elements show that it is still in orbit but I have not been able to hear it on 10M?

Regards
Aaron

In orbit, yes. Functional, no. I miss it; RS-10/11 was a great satellite.

MIR IS pretty easy to work, I routinely work MIR with my HT and a jpole.
Not the best way to do it, but it does work.

Hi,

I just bought a second handed scanner the ICOM IC-R100.
It's a great scanner allthough i'm missing the manual.
I need some help to scan a certain frequency, does somebody know how this scanner has to be programmed for running between 2 freguenties.
for example between 30.000 and 40.000. Any help is appreciated.
please mail me to yvonowee@hotmail.com

p.s. if someone has the manual in a txt file or doc it would be terrific when you send me a copy

best regards, Yvonne

Dove would be a lot more fun to listen to if the digital voice
were reactivated by it's keepers. AO-21 had a digital voice aas well as a
packet message that was regularly employed. It was certainly a great deal
more useful in the classroom in that configuration.
DO-17 operators, how about some variety?

Dick, N1MDZ

The last I heard Dove has been down due to software problems. I haven't tried
listening in a while though. I'll have to do that this week.

Did you leave a message? If so you'll need the message number and the usual card info.

As far as being easy goes it's not uncommon to make contacts with 5 watts but can be difficult at times because of the competition. Usually early morning hour attempts with that set-up are easier.

Hello All;
I just purchased this keyboard new but I can not use it because I have no Comports available. The keyboard goes into a standard 5 pin keyboard slot and the touchpad connects to Com 1 or 2 [I do not Have] New is sells for $89.95+shipping. Still has the 3 year warranty included. Asking $45+shipping Email: n2rif@amsat.org Phone is usually busy but can try 609-386-9382 from 10am to 10pm daily.
Thank you for reading my sale bulletin..de Thomas J -73

Here are the specifications:
NEW - Nimble Multipurpose Win '95 Digital Touch Keyboard
Keyboard Features:
Designed for Microsoft Windows 95 / 3.1 Esc, Tab, Bksp, Ctrl, Alt & Windows 95 keys for easy access Soft-caps of hard-caps are all double-injection keycaps Patented design key switch for bounce, stable switch-travel and a soft, sensitive touch to reduce the strain of typing. Concave design palm-hand rest helps both hands and wrists feel more comfortable Key switch lifecycle bears 30,000,000 times 3 clustered LED N C S Lock

Digital Touch-Pad Features:
Can be used as an input device between relative or absolute coordination mouse mode under any software application. Can switch between relative or absolute coordination mouse mode by using soft-switch under Windows 3.1 or Win95. ITO transparent touch panel with long life for up to 5 million uses. Wireless input pen without switch to avoid restraint by a cable.(Any pen or finger can be used as an input pen.) Touch pressure is only 5-10g for easy writing and moving. High resolution: 1024 x 1024.Transmission speed: 9,600 baud rate. Provides double-click and drag functions.Working area: 52x40mm (small enough to be used in the palm of your hand) Comes with "Quick Point Signature" that can put your signature on any document for all Windows applications.

While I'm sure there is some sort of internal politics behind
this spate of vicious attacks on amsat launch prospects,
it really is not of interest to the rest of the space
community, guys. Give it a rest, or keep it in your own
discussion areas at least.

Note followups.

George,

My usenet posts have expired beyond 6/06/98 and I haven't found
the "vicious attacks on amsat launch prospects" that you mentioned
in any of the recent postings. Are you serious? Which "discussion
areas" should I look to for information about AMSAT launches?

1349. Complete satellite station for sale

Newsgroup: rec.radio.amateur.space
Date: 1998-06-15 00:00:00 UTC
From: Richard Provencal <Richard.Provencal@umontreal.ca>
Message-ID: <5EZg1.2048$k93.6802544@carnaval.risq.qc.ca>
Source record: 15929

SATELLITES TRACKING EQUIPMENT FOR SALE

I have for sale my complete satellite tracking equipment which include:

Yaesu 736r ready for 9600 bauds (Digital sats KO-23, KO-25, UO-22)
Telex HyGain Oscar Link 435Mhz/145.9Mhz antennas.
Yaesu Elevation-Azimuth Dual Controler Rotor G-5400B including control
cables.
AEA TNC DSP2232 with power supply and cables.
Mirage mast mount preamplifier KP-2 70cm.
Icom mast mount AG-25 preamplifier 144-148Mhz.
Computer control card "Kansas City Tracker with Tuner".

The sale includes all coaxes and cables.

The price: $2500.OO US

MONDAY JUNE 15, 1998

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* AMSAT-UK COLLOQUIUM 1998 *
============================
AMSAT-UK's 13th Annual Colloquium takes place at the University of Surrey
from 31st July to 2nd August 1998. Booking forms are included in the issue
of Oscar News publishing mid-June; accomodation and price information
is included with these forms. Others requiring them can obtain them by
download from the Colloquium web-site (in Word-6 format); or by sending a
self addressed envelope (UK applicants are expected to pre-pay the postage)
to the AMSAT-UK office at:

AMSAT-UK (Colloquium)
40 Downsview
Small Dole
W Sussex BN5 9YB
UK

Phone +44 (0)1273 495733; fax +44 (0)1273 492927
e-mail: g6zru@amsat.org

Information regarding the Colloquium will be available on the AMSAT-UK's
World Wide Web pages at http://www.uk.amsat.org/ within a few days.

Applications received later than 15 July will attract a 15% surcharge.
Likewise, cancellations after that date will forfeit the full amount
(unless we are able to fill the empty slot). Application forms should
be sent to the AMSAT-UK Office (above), *NOT* to UoS.

The lecture program this year has been enlarged, with an extra 90 minute
session on the Friday evening to accomodate the extensive response to the
call for papers. We are also fortunate to have a presentation by NASA
astronaut Don Thomas, KC5FVF.

There will also be the usual extra events including: Command Station visits, Annual Dinner and Auction (please bring something to sell), AMSAT-UK annual meeting, microwave equipment testing, and other fun as well as the "usual" Friday evening barbecue in the University grounds, and a space-oriented Pub Quiz in the bar.

Last year's change to the booking requirements, to accept unregistered day attendees subject to space, will be repeated this year but they will not receive a free lunch. As usual, facilities will be available for attendees who wish to arrive at UoS on the evening before the event starts and/or stay over afterwards on the Sunday night.

This year there is a related event at UoS during the two days prior to the Colloquium: the International Space Station meeting is open to everyone; information from G3AAJ. (Pricing is the same as for the Colloquium)

The program (to date) consists of:

IARU International Forum; UoS Graduate papers; Future SAREX Plans; Balloons; Satellites in Education; Microwave Basics; Software Radios; Astronaut presentation; Phase-3D Subjects; 23cm PA and Front End; Microsat Attitude Determination Experiment; Zero-IF Microwave Transceivers; Automatic doppler correction for analogue transponders; Russian Retrograde Launches; What's Next in Amateur Radio Satellites; International Space Station, presentation & forum; Techsat 1B overview/report; Sunsat; Arizona State University ASUSat-1 overview; Amsat-UK Annual General Meeting.

Hope to see you there.

* FINAL MESSAGE FROM ANDY THOMAS *
==========
The following is the final message issued on 1998-Jun-08 from Andy Thomas before his departure from the Mir space station:

I AM LEAVING MIR TODAY AND THIS WILL BE MY LAST MESSAGE. THANK YOU ALL FOR YOUR INTEREST IN THE MISSION AND YOUR MESSAGES. SORRY I CAN NOT GIVE RESPONSES TO ALL OF YOU BUT THE VOLUME OF TRAFFIC IS TOO LARGE. IT HAS BEEN WONDERFUL, AND I WISH YOU ALL EVERY SUCCESS. GOOD BYE AND GOOD LUCK. ANDY THOMAS.

[Info via Dr. Dave Larsen, N6CO]

* UoSAT-OSCAR-22 SIGNAL FADING *
==========
Pat Gowen, G3IOR, reports that the recent deep fade outs that Roger, G3LDI (operating SATGATE GB7LDI) has experienced on UoSAT-OSCAR-22, coupled with Richard, G3RWL's findings of the reversal of circularity on the downlink are apparently not unique. Art, G4JY has also noted this effect when UO-22 is at low elevation angles, even at times when Sporadic-E propagation is not in evidence.

John, GM4IHJ considered the findings, and came up with points that might explain the anomaly. Firstly, he pointed out that the downlink of UO-22 is decidedly NOT RHCP, but engineered to give a signal approximating this to help give optimum freedom from losses caused by Faraday rotation. GM4IHJ has long had polarity selection. He finds times when RHCP is best, others when LHCP optimises, and also times when linear horizontal or vertical is to be preferred. Only at high elevation angles when the gravity gradient boom and hence the antennas are earth pointing does RHCP use seem to be at its best.

He suggests that the attenuation brought about by the path intervention of intense Es reduces the signal down to that level where the fade-outs become highly noticeable, so stimulating attempts to improve by selecting other polarizations than the normally employed RHCP. When a signal is weak, a loss of 3 - 6 dB is very marked, sometimes taking the signal below the noise threshold. When the signal is strong, the loss is barely noticeable,

as a signal well above cut off can normally be maintained.

So perhaps it is not a strange propagational effect suggesting a change from RHCP to LHCP under Es conditions as first thought, but a perfectly natural occurrence. Even so, users may consider experimenting by noting their findings while the Es season is with us at this time of the year.

[Info via Pat, G3IOR]

* TMSAT LAUNCH NEWS *
==========
The TMSAT microsatellite is due for launch on the 23rd June on board a Zenit launch vehicle from Baikonur Cosmodrome. It will be placed into a 821 km sun-synchronous orbit with a local ascending node time of approximately 21:37 UTC.

A brief overview of the TMSAT commissioning plan is available at:

http://www.ee.surrey.ac.uk/EE/CSER/UOSAT/amateur/tmsat/
tmsat_commissioning_plan.html.

Further information will be posted to UO-22 as the launch draws nearer, and updates on the commissioning itself will be uploaded to TMSAT and UO-22 following the launch.

All initial commissioning will be carried out using the 9600 baud downlink, so stations equipped to receive the present 9600 baud amateur spacecraft will be able to receive TMSAT on 436.925MHz.

* ARRL FILES AGAINST LMCC *
==========
The American Radio Relay League has asked the FCC to immediately dismiss efforts by the Land Mobile Communications Council to gain primary access to 420 to 430 MHz and 440 to 450 MHz as well as other UHF allocations. The LMCC recently petitioned the FCC to reallocate the two 70-cm segments from the federal government to the Private Mobile Radio Service. Amateur Radio enjoys the use of 420 to 450 MHz on a secondary basis. In comments filed on RM-9267, the League said the LMCC proposed the switch "without establishing technical compatibility between PMRS operation and incumbent radio services in any of the bands sought."

The League said that existing federal government use of the spectrum precludes PMRS operation at 420 to 450 MHz. According to the ARRL,

the petition fails to demonstrate any basis to withdraw the two band segments from federal use nor any compatibility between PMRS operation and either federal government or Amateur use. In addition, the League said, the petition fails to justify displacing established amateur operations. The League pointed out that the amateur community uses the band for public service and public safety functions and that hams have "substantial personal investment" in equipment that's in regular use there. The ARRL urged the Commission to throw out this portion of the LMCC petition "without further consideration."

The League backed up its arguments by citing documents from the National Telecommunications and Information Administration (NTIA), which manages federal spectrum. "NTIA has made it quite clear that there is no possibility of additional sharing of the 420-450 MHz band, and the unique relationship between Federal radiolocation uses and the Amateur Service cannot be duplicated by PMRS users," the ARRL said.

The ARRL said that the LMCC petition was premature because it did not take adequate account of the benefits of spectrum refarming already initiated. The League said PMRS users should adopt already available spectrum-efficient technologies to maximize their use of existing allocations before seeking additional spectrum at the expense of other users. The League also said that PMRS users should look into using the Commercial Radio Mobile Service (CMRS).
A copy of the League's comments is available at:

http://www.arrl.org/news/bandthreat/RM-9267/arrl-cmt.html

1351. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.space
Date: 1998-06-15 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6m26m1$p8h@news.Hawaii.Edu>
Source record: 15931
Cross-posted to: rec.radio.amateur.space,rec.answers,news.answers

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists
==========

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

1352. 2nd Straw Poll: rec.radio.amateur.* reorg

Newsgroup: rec.radio.amateur.space
Date: 1998-06-15 00:00:00 UTC
From: Jeremy Billones <billones@primenet.com>
Message-ID: <6m30dqehu1@clarknet.clark.net>
Source record: 15932
Cross-posted to: rec.radio.amateur.space,rec.radio.noncomm,rec.radio.scanner,rec.radio.shortwave,rec.radio.swap

LAST CALL FOR VOTES (of 2)

Votes must be received by 23:59:59 UTC, 22 Jun 1998.

This vote is being conducted by a neutral third party. Questions about the straw poll should be directed to the rec.radio.amateur.* Working Group at <rra-wg@theporch.com>

Votetaker: Jeremy Billones <billones@primenet.com>

STRAW POLL Q & A

Q: Who is doing this?
Q: How may I join the rra-wg?
Q: Why are we doing this?
Q: What are we doing?
Q: More to the point, why are we "kicking over this hornet's nest?"
Q: Why do you want to change the newsgroups again?
Q: Who are you to tell us what to do with "our" newsgroup?
Q: How long ago were each of the rec.radio.amateur.* newsgroups created?
Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and rec.radio.swap included in this opinion poll?
Q: Where can I obtain a copy of the original newsgroup charters?
Q: Where can I find out more information about the Usenet RFD/CFV process?
Q: I don't want any of the newsgroups to change. What should I do?
Q: I want to go back to one single newsgroup for amateur radio on Usenet, like we had back in the 1980's. What should I do?
Q: I support some of the newsgroups for amateur radio, but not others. What should I do?
Q: I support the existence of a newsgroup, but disagree with its charter. How should I vote?
Q: I would like new newsgroups to be created, what should I do?
Q: I have no opinion, what should I do?

Q: Who is doing this?

The rec.radio.amateur.* Working Group (rra-wg@theporch.com, which initiated the last major reorganization in 1993) is the point-of-contact for questions about this opinion poll. Principal members are Paul W. Schleck, K3FU, and Jeffrey Herman, KH2PZ. Though not an rra-wg member, Gary Coffman, KE4ZV, also endorses this opinion poll. this opinion poll will be conducted by an unbiased third party from the Usenet Volunteer Votetakers (UVV), Jeremy Billones (billones@primenet.com).

Q: How may I join the rra-wg?

Anyone who volunteers may join the rra-wg. The rra-wg has always solicited volunteers from when it was created in 1993 (originally named rra-reorg) to draft an RFD to reorganize the rec.radio.amateur.* newsgroups (and continues to serve as an advisory group for FAQ maintainers and new newsgroup proponents). You may join the rra-wg by subscribing to its mailing list.

The automated list manager address is

listproc@theporch.com

Use this for subscribing, unsubscribing, getting archived info, getting the FAQ message, changing your address, etc.

To subscribe, send a message to this address with "subscribe rra-wg <your name>" Similarly, to unsubscribe, replace "subscribe" with "unsubscribe"

The list owner address is

listown@jackatak.theporch.com

Use this address only when there is a problem which really truly can't be resolved otherwise.

Q: Why are we doing this?

Discussion on the rec.radio.amateur.* newsgroups shows that there is a difference of opinion about the current newsgroups and their charters. Assertions on one side of the argument that the charters were voted upon by the readers have been countered with assertions on the other side that the votes took place years ago, by a very small minority of the current readership. There is also the strongly-held opinion among some that we have "too many newsgroups." The following is a sample posting from the discussion thread on rec.radio.amateur.misc that led to this opinion poll (the entire thread may be viewed at DejaNews, http://www.dejanews.com/):

Q: What are we doing?

As a preliminary (and perhaps even diverting) step to an RFD (which would be very laborious and time-consuming, and perhaps unnecessary), we will conduct a Straw Poll, or "Vote of Confidence" (similar to the vote of confidence for a Prime Minister made by British Parliament, or a non-binding resolution of the U.S. Congress). We do it Usenet-vote style (utilizing a neutral vote-taker from the UVV). During the poll, a vote is taken where a "Vote of Confidence" yeah or nay for each newsgroup, as currently constituted and chartered, is given by each voter (YES/NO/CANCEL/ABSTAIN votes are valid).

What votes mean:

YES: I support the existence of this newsgroup and its charter

NO: I disagree with this newsgroup's charter or I believe that this newsgroup's existence should be reconsidered in a future RFD/CFV

CANCEL: Delete any previous votes I made concerning this newsgroup

ABSTAIN: I have no opinion concerning this newsgroup

Each newsgroup that does not pass a vote of confidence by Usenet voting standards (2/3 and 100 vote majority of YES versus NO votes) may be referred to the Usenet newsgroup creation process where their deletion or modification (based on a rough consensus of the preceding 30 days of discussion and how much they lost in the vote of confidence) is proposed. Each newsgroup that does pass a vote of confidence will have its charter, and justification for existence, reinforced to the readership (as the current readership voted on it).

Q: More to the point, why are we "kicking over this hornet's nest?"

Sometimes hornet's nests can get big enough that they wind up falling down anyway. As shown in the thread above, there are significant undercurrents of disagreement over the current newsgroups, their charters, and even the suggested guidelines and rules of net-etiquette that many on the newsgroups advocate. If this opinion poll shows strong agreement with current practices, then that would help reduce (though not eliminate) newsgroup arguments on the subject. If, however, this opinion poll shows strong disagreement, then it's probably better that we know that right away, and take steps to fix the current situation before it degrades any further.

Q: Why do you want to change the newsgroups again?

Only some of the proponents of this opinion poll wish to change the newsgroups. Some wish to simply have the current newsgroups and their charters reinforced. All of the proponents agree that an up-to-date opinion poll of the readership is desirable at this time. Whatever future actions will be taken will be determined by the results of this opinion poll.

Q: Who are you to tell us what to do with "our" newsgroup?

One answer is that on Usenet, no one "owns" an unmoderated newsgroup. Newsgroups are voted into existence by a democratic process to determine consensus (and lack of significant objection) for using shared network resources to support them. All of the existing rec.radio.amateur.* newsgroups passed such a vote at some time in the past, and should pass such a vote again if there is strong support for their continued existence.

Another answer is that this is just a non-binding opinion poll of the readership to determine a consensus, if any, for making changes. It would still be necessary to undertake a formal RFD/CFV process to change any Usenet newsgroup (and that was always possible, anyway).

It should also be emphasized here that no individual rec.radio.amateur.* newsgroup is being singled out. Rather, a consensus of the readership concerning ALL rec.radio.amateur.* newsgroups is being sought.

Q: How long ago were each of the rec.radio.amateur.* newsgroups created?

1972 (or possibly earlier, this date is when UCSD joined the ARPANet):

Info-Hams (original ARPANet mailing list at Simtel-20, continues today at UCSD as a gateway of rec.radio.amateur.misc)

1979:

Creation of Usenet News at Duke and UNC

early 1980's:

fa.info-hams (fa = "From ARPANet") *
net.ham-radio (pre-Kent Paul Dolan "Great Renaming") *

mid 1980's-1991:

rec.ham-radio *
rec.ham-radio.packet *
rec.ham-radio.swap *

1991 Reorganization:

rec.radio.amateur.misc
rec.radio.amateur.packet *
rec.radio.amateur.policy
rec.radio.cb
rec.radio.swap

1992/3 Addition:

rec.radio.info

1993 Reorganization:

rec.radio.amateur.antenna
rec.radio.amateur.digital.misc
rec.radio.amateur.equipment
rec.radio.amateur.homebrew
rec.radio.amateur.misc
rec.radio.amateur.policy
rec.radio.amateur.space

1996 Additions:

rec.radio.amateur.dx
rec.radio.amateur.boatanchors

* = obsolete

Current newsgroups covered by this opinion poll, and the years
in which they were created:

rec.radio.amateur.antenna (1993)
rec.radio.amateur.boatanchors (1996)
rec.radio.amateur.digital.misc (1993)
rec.radio.amateur.dx (1996)
rec.radio.amateur.equipment (1993)
rec.radio.amateur.homebrew (1993)
rec.radio.amateur.misc (1991)
rec.radio.amateur.policy (1991)
rec.radio.amateur.space (1993)
rec.radio.info (1992/3)
rec.radio.swap (1991)

Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and
rec.radio.swap included in this opinion poll?

Though one level up in the rec.* hierarchy, these newsgroups are
principally used by readers of rec.radio.amateur.*, and their fates
would substantially be decided by any significant reorganization of the
rec.radio.amateur.* newsgroups. Though created by a rec.radio.amateur.*

reorganization, rec.radio.cb is not included in this opinion poll.

This announcement has been cross-posted to all rec.radio.* newsgroups (except for rec.radio.broadcasting and rec.radio.info, which are moderated). In addition, the following individuals were consulted prior to this announcement (note that consultation does not necessarily imply endorsement):

Richard Eckman, KO4MR, Proponent of rec.radio.amateur.dx
Brian Kantor, WB6CYT, Administrator of Info-Hams/Ham-* mailing list gateways of rec.radio.amateur.* newsgroups at UCSD
Ian Kluft, KO6YQ, Proponent of 1993 rec.radio.amateur.* reorganization, former rec.radio.amateur.* FAQ Maintainer
Jay Maynard, K5ZC, Proponent of 1991 rec.radio.amateur.* reorganization
Brian Short, K7ON, Moderator of rec.radio.info
Rick Stealey, K2XT, Proponent of rec.radio.amateur.boatanchors

Q: Where can I obtain a copy of the original newsgroup charters?

ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.info
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur-reorg
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.dx
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.boatanchors

Q: Where can I find out more information about the Usenet RFD/CFV process?

ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Create_a_New_Usenet_Newsgroup
ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Format_and_Submit_a_New_Group_Proposal
ftp://rtfm.mit.edu/pub/usenet/news.groups/Guidelines_on_Usenet_Newsgroup_Names

Q: I don't want any of the newsgroups to change. What should I do?

Vote "YES" for all of the existing rec.radio.amateur.* newsgroups.

Q: I want to go back to one single newsgroup for amateur radio on Usenet, like we had back in the 1980's. What should I do?

Vote "NO" for all (or all but one) of the newsgroups.

Q: I support some of the newsgroups for amateur radio, but not others. What should I do?

Vote "YES" for any newsgroups that you wish to remain unchanged, and vote "NO" for any newsgroup you wish to have reconsidered in a future RFD/CFV.

Q: I support the existence of a newsgroup, but disagree with its charter. How should I vote?

Since this opinion poll is for both the existence of given newsgroups AND their current charters, you should vote "NO" for that newsgroup. Again, this is a non-binding opinion poll simply to determine if current newsgroups should be considered for modification or deletion, not a vote

to actually modify or delete these newsgroups.

Q: I would like new newsgroups to be created, what should I do?

Creation of new newsgroups is not being considered by opinion poll. A future RFD/CFV would have to be initiated to do this. You are, of course, welcome to express your opinions concerning new newsgroups by posting them to rec.radio.amateur.misc (*NOT* by E-mail to the vote-taker).

Q: I have no opinion, what should I do?

You may wish to read the preceding 30 days of public discussion on rec.radio.amateur.misc about this opinion poll to develop your own opinions (go to http://www.dejanews.com/ and search for "STRAW POLL"). If, after reading the public discussion, you still remain undecided, you may abstain from this opinion poll. You may do so informally by not participating in it at all, or formally by explicitly voting "ABSTAIN" for all of the newsgroups.

IMPORTANT VOTING PROCEDURE NOTES:

Standard Guidelines for voting apply. One vote per person, one account per voter. Votes must be mailed directly from the voter to the votetaker. Anonymous, forwarded or proxy votes are not valid. Votes mailed by WWW/HTML/CGI forms are considered to be anonymous votes.

Vote counting is automated. Failure to follow these directions may mean that your vote does not get counted. If you do not receive an acknowledgment of your vote within three days contact the votetaker about the problem. It's your responsibility to make sure your vote is registered correctly. Duplicate votes are resolved in favor of the most recent valid vote. Addresses and votes of all voters will be published in the final voting results post.

HOW TO VOTE:

Extract the ballot from the CFV by deleting everything before and after the "BEGINNING OF BALLOT" and "END OF BALLOT" lines. Don't worry about the spacing of the columns or any quote characters (">") that your reply inserts. Please, DO NOT send the entire CFV back to me!

Fill in the ballot as shown below. Please provide your REAL NAME and indicate your desired vote in the appropriate locations inside the ballot.

When finished, MAIL the ballot to: < voting@clark.net >
Just "replying" to this message should work, but check the "To:" line.

Examples of how to properly indicate your vote:

[YES] example.yes.vote
[NO] example.no.vote
[ABSTAIN] example.abstention
[CANCEL] example.cancellation

DO NOT modify, alter or delete any information in this ballot!
If you do, the voting software will probably reject your ballot.

If these instructions are unclear, please consult the Introduction to
Usenet Voting or the Usenet Voting FAQ at http://www.iki.fi/~jpatokal/uvv.

======== BEGINNING OF BALLOT: Delete everything before this line =======
.---
| 1ST STRAW POLL: rec.radio.amateur.* reorg

Source record: 15934

Congratulations Dan,

The 847 is an excellent radio. I would recommend you start with the
AMSAT web site: http://www.amsat.org/

Lots of on-line text and several books/software to buy. Check out some
of the Nets (http://www.amsat.org/amsat/activity.html). Join AMSAT --
lots of great resources.

Also, check with your local clubs and ARRL (http://www.arrl.org/) to
determine what local hams are into satellite work.

I highly recommend The Satellite Experimenters Handbook. A new edition is out, and you can get yours at Ham Radio Outlet in Tigard. This book is the starting point on Amateur Satellites.

What group other than rec.radio.amateur.space do you think this argument
does belong in George?

Mark,
I have had great success with the Advanced Receiver Research (ARR)
tower-top preamps. I recommend the GaAsFet model, which has about 24 dB
of gain across the 2 meter band, a +12 dB third order intercept point
(will eliminate a lot of overload intermodulation) and only a 0.55 dB
Noise Figure. The tower-top model is RF switched for 160 watts
automatically, and can either be fed with 12V through a separate
connector, or on the coax with a minor mod. I've had mine up for about
3 years now, in a VERY hot environment (Near Phoenix, where summertime
ambient temperatures can be 120 degrees, and inside of weatherproof box
probably another 30-40 degrees hotter) without any noticeable
deterioration or degradation.

I'm sure there are other good ones out there, but the ARR has a
reputation as the "Cadillac" of the group. I believe that list price
for the VHF and UHF models is about $210.

Good Luck,

Rick Tannehill W7RT

1358. PH3D ARRL AMSAT "other agencies"

Newsgroup: rec.radio.amateur.space

Quote from ARRL statement attributed to AMSAT:
.....
"Baker said AMSAT is continuing to look for a suitable launch
opportunity and now is looking at ''other agencies'' instead of
limiting itself to ESA's Ariane program. ''We're standby passengers,''
he said.".....
~~~~~~
I hope AMSAT can communicate information like this more directly
to the members via internet in the furture. Does anyone know when
this information was sent to ARRL? Are the "other agencies" AMSAT
is "looking at" unnamed out of oversight or is the information being
kept confidential for some reason?

I'm not sure it belongs in any groups outside r.r.a.s
I have so set followups, though people can override that
if they have particular comments to make of general interest.

I'm not sure it belongs anywhere, to be honest, I don't see
why someone is going after ESA and AMSAT, the only reason I can
think of is some sort of internal politics I am not aware of.

Space group hopes to launch first amateur rocket into space
A HAL5 Project news release
June 17, 1998

On Saturday morning, a small group of space enthusiasts will attempt to make space history by sending the first amateur rocket into space - and the first hybrid rocket into space ever. Press and visitors are welcome to attend. The Press Site will be located at the "Sea Lab" on the east coast of Dauphin Island, 40 miles south of Mobile, Ala.

The group is the Huntsville Alabama L5 Society (HAL5), a chapter of the grassroots National Space Society (NSS). The rocket will be launched from a high altitude balloon - a concept called a "rockoon". For this reason, HAL5 named its project High Altitude Lift-Off (HALO).

For safety reasons, the balloon will be launched from a barge (provided by NASA) out in the Gulf of Mexico, about 60 miles southeast of New Orleans. June winds will carry the balloon about 30 miles southwest as it rises to 100,000 feet. The command to launch the rocket will be sent only once the balloon is safely over open ocean and the rocket is pointed away from land.

The balloon gondola will carry an amateur television (ATV) camera to record the launch live and transmit the color video

back to earth. The frequency is 434.00 MHz, which corresponds to Cable Ready TV channel 59. The rocket also will carry an ATV camera, a higher-resolution color model. The frequency is 1255 MHz. The rocket will also being transmitting telemetry data via APRS packet radio on a FM frequency of 441.050 MHz. For more details, please see the Web site.

Altitude verification for the rocket will be primarily based on signals from an onboard Trimble GPS receiver. Backup will come from accelerometer data, and then from the video camera, which is oriented so that the curvature of the Earth can be viewed, recorded, and later measured to estimate the altitude.

The balloon launch is scheduled for 7 AM CDT, to obtain calm winds and to satisfy FAA requirements. Rocket launch will occur about 2-1/2 hours after the balloon launch (about 9:30 AM CDT). If Saturday is windy or rainy, the launch will be postponed until Sunday, or three weeks later on Saturday, July 11.

Because the balloon will be launched from a barge with very limited passenger capacity, members of the Press and other visitors should go to the Press Site to be setup at the Sea Lab on the east coast of Dauphin Island, 40 miles south of Mobile, Alabama. The NASA barge will leave Michoud, La., on Friday morning, providing plenty of time for reporters who wish to observe the departure to reach the Dauphin Island site before the Saturday morning balloon launch.

If the recovery boat has room, some members of the Press will be allowed onboard. It is hoped that the boat will be fast enough to observe the balloon launch from the barge, then track the balloon to the recovery point.

For more details (including directions, hotels, restrictions, and requirements), please see the HALO Web site.

Via Project HALO, HAL5 is bringing up to modern standards a launch vehicle concept called a "rockoon". A rockoon is a rocket that is launched from a high altitude balloon. The rockoon approach allows a small rocket to obtain a very high altitude because there is little air to slow it down during launch. Rockoons were first flown by James Van Allen in the 1950's as part of a joint Navy/university project, but were abandoned when sufficiently large ground-based sounding rockets became available.

HAL5 made amateur rocketry history last year (May 11, 1997) when it successfully performed the first amateur rockoon mission from a high altitude, and made professional rocketry history by launching the first hybrid rocket from a high

altitude. For more details on the historic Sky Launch 1 rockoon mission, please see this HALO Web site.

Since 1994, HAL5 has updated the rockoon concept using modern amateur rocketry and electronics technology, added to today's now-affordable composite materials and high altitude balloon technologies. HAL5's goal is to make space more affordable for students, amateurs, experimenters, and researchers.

In 1996, the NASA Marshall Space Flight Center (MSFC) expressed to HAL5 its interest in the rockoon approach. In an effort to find new ways to reduce the cost of rocket launches, NASA is examining alternate launch sites and methods. HAL5 and NASA MSFC signed a Cooperative Agreement in October 1996 for the Sky Launch 2 (SL-2) rockoon mission. For SL-2, HAL5 is providing the amateur rocket, high altitude balloon, launch support hardware, tracking equipment, and recovery boat.

NASA MSFC and the NASA Michoud Assembly Facility are providing an oceangoing barge to serve as the balloon launch platform, plus helium for the balloon, nitrous-oxide for the rocket, and some money towards the reimbursement of materials purchases. HAL5 is raising the rest of its money via its Donation Program. For more details on NASA's role in the historic SL-2 rockoon mission, please see this NASA Web site.

The HALO SL-2 rocket utilizes hybrid propulsion, whereby an inert solid fuel is kept safely away from a liquid oxidizer until the rocket is ignited. The solid fuel used for the HALO rocket is pure asphalt, the same material used on streets and roofs. The liquid oxidizer used for the rocket is nitrous-oxide, the same "laughing gas" used by dentists. This simple fuel combination is 85% as effective as the best aerospace industry solid rocket propellants (250 vs. 300 vacuum specific impulse).

After constructing a small rocket motor test facility in early 1995, HAL5 performed over 60 static firings of its hybrid rocket motors. In 1996, HAL5 launched its first hybrid rocket from the ground, and then in 1997, launched the first hybrid rocket from a high altitude.

The home-built HALO SL-2 hybrid rocket, to be launched from a balloon over the Gulf of Mexico, will become the first of its kind to ever make it into space - if it successfully exceeds an altitude of 50 nautical miles (300,000 feet). The official record for highest altitude achieved by a hybrid rocket is held by a NASA-industry team who, on Jan. 8, 1997, sent a nitrous-oxide and HTPB-rubber hybrid sounding rocket from the ground to 20 nautical miles. Unofficially, HAL5 has estimated that its HALO hybrid SL-1 rocket, launched May 11, 1997,

reached an altitude between 30 and 36 nautical miles. The HALO team has worked very hard during the past year to ensure that the new HALO SL-2 rocket will send back data and video throughout its balloon ascent, rocket trajectory, and landing by parachute.

The high-altitude helium balloon to be used, purchased from Raven Industries, is made of clear polyethylene plastic over 120 feet long, but thinner than a sandwich bag (only 0.35 mils thick). At the launch altitude of 100,000 feet, the balloon, which has a volumetric capacity of 245,000 cubic-feet, will expand to 78 feet in diameter. Floating in the frigid thin upper atmosphere, the balloon will be brittle enough to "pop" when the HALO SL-2 rocket safely shoots through it.

For more information on the entire HALO program, please see the main Project HALO Web site (http://advicom.net/~hal5/HALO/).

It's confidential because any launch AMSAT can afford will be at an extremely deep discount - a few cents on the dollar compared to a commercial launch. Launch agencies do not want to antagonize their commercial customers by letting it be known that some people get freebies. Others might start demanding similar discounts, which launch agencies can't afford.

Progress reporting is much the same thing - only people who can afford real commercial launches can afford milestones and progress reports. We are flying standby, and will fly when there is space available. Not until.

All you need is high-school algebra and trigonometry to work it
out yourself. A diagram would be really handy here, but...

Let

d = the line of sight distance
r = Earth's radius
h = transmitter height

Starting at the centre of the Earth, draw a line to the transmitter.
Its length is r+h. Draw a line from there to the horizon. Its length
is d. Draw a line from there back to the Earth's centre. Its length
is r, and forms a right angle with previous leg of the triangle (radius
and tangent). The sides of the triangle are then related by Pythagoras,

d**2 + r**2 = (r+h)**2

Solve for d and you're done. Take advantage of the fact that r>>h to
simplify the calculation.

It's obvious that finding a cheap launch for a little satellite
is easier than finding a cheap launch for a big one. This doesn't
rule out cheap launches for big satellites; it just makes them
harder to come by.

Un-cheap launches are hardly "pay thru the nose". Launching things
is a business - a competitive one - operated by people who expect
to make money at it. They must cover launch costs, development costs
(a *big* issue with Ariane 5), and so on. And have some left over
to pay their shareholders.

As long as I've known about the Amateur space program (which is about 30 years, or so) I've understood quite clearly that hams got a break on launch costs. I think most hams have known that. To suggest that launch agencies do not want to let it be known to their commercial customers that some people (i.e. hams) get such a break is ridiculous. The commercial customers know what's going on, it's no secret. What do you think, that there's all these thousands of hams all over the world that know about the price break that hams have received from launch agencies, but for some reason the commercial customers are all just so in the dark about that? (Sheesh.)

[And besides, _if_ it were a secret, well, you just blew it by spilling it out all over a USENET newsgroup. <g>]

There may or may not be valid reasons for confidentiality within the Amateur space program, but I'll leave that for others to debate. However, your argument about that (above) just doesn't hold water.

It's the difference between people knowing the general idea,
and blabbing sensitive details. Which may very well be
confidential under the terms of launch contracts - even for
full-fare commercial customers.

Don't ask me - I don't have the information, and couldn't
divulge it if I did. If you had the information, what would
you do with it, anyway?

If you have an issue with this, take it up with the AMSAT
board, through appropriate channels. Which isn't me (though
I have given the notion some thought...), and which isn't here.

Mike,

If you don't get any other offers, I can probably copy the
article and either send or fax it to you. (Email me your
address or fax number.)

One thing to clarify: The software TSR written by wb4gcs
is for dos.

To use this interface with winorbit, you need either
PRRIETRK (available from the AMSAT-NA FTP site), or Winprairie
(available in Beta from the WInorbit home page.)

I've been using the Prairie Digital board for quite a while
now, interfaced to 2 TV rotators, and found it to be a great
way to implement cheap computer guided az/el control...

Regards,

-al

1374. How to?...store & forward, SatGates

Newsgroup: rec.radio.amateur.space
Date: 1998-06-19 00:00:00 UTC
From: skl@u.arizona.edu
Message-ID: <skl-1906981632140001@eeb4.biosci.arizona.edu>
Source record: 15954

Hi all,

I'm looking into communications options from jungles of Camaroon to US, and thinking about amature satellite. I've read bits and pieces about Store and Forward...sounds sort of like a BBS? and SatGates - are they accessable without a radio, e.g., via dial-up or telnet?

I'm wondering...if I send a message/textfile from Cameroon to be stored on a satellite, can a non-HAM retrieve that message via a SatGate? Is there such a thing as amsat email? Where can I find more info on this stuff?

I'd be attempting satellite uplink with a 70cm or 2m HT with a grounded 1/2-wave antenna. Most of the time that antenna will actually be flown from a kite (ungrounded), attempting to pick up very weak packet signals from the surrounding area, then repeating those signals down to camp. So, I suppose I could go the otherway, having the kite/anteanna repeating my HT's signal, to be picked up by the satellite. Think that might work?

Any comments/advice much appreciated,
-Spencer

The duplicity of ESA and Arianespace is posted for all the world to see on the AMSAT website today. I suggest everyone read Dr. Meinzer's report, and ask themselves, did or did not Arianespace break both verbal and written contracts? I think most reasonable people will answer in the affirmative. Clearly, we were patsy's playing hardball with the big-boys, and came out second best. It's time to expose Arianespace's duplicity, and demand some concessions.

Amazing.

You post a simple question to ONE newsgroup (this one) and the distorted reply chain ends up on 4 more permutated into utter trash.

I guess that's usenet. I shouldn't be surprised, but it's sure changed a lot since I started reading news 10 years ago.

Sad......

First of all, P3D is hardly the only bird the Amateur Community has, so SURE keep the newsgroup alive!

As far as P3D, I am assuming from the tone of AMSAT's notice that $10 mil US is the price to beat. I am checking into my contacts at present. Of course the first response was 'Sure we will lob it up for $270 mil on the Shuttle' but he was yanking my leg. I suggested perhaps a shared ride with a commercial payload, but was told that a commercial type might not want us along for the ride because we might mess up their payload.

I really do not know who to contact on the Soviet side, maybe Konstantin Gvozdev could clue us in on that one.

Another thing that should probably happen is a vote as to whether or not we should yank out our checkbooks to fund the lofting of P3D or scrap the project because of its ambitious size.

Comments?

I understand that AMSAT is doing just that. But the problem is the cost of a launch on a fairly large rocket. If we bill Arianespace for the cost of designing and building the SBS, which they've already used 1 of for the 502, we might be able to afford such a launch, on maybe a Russian Proton rocket. I believe the value of the SBS to Arianespace is $10M and that is what we should bill them.

I'm trying to ascertain which of the amateur satellites are currently operational in mode A (145 MHz up, 29 MHz down). Here's what I've been able to glean from websites and this ng:

RS10 is no longer working.
RS15 is working, but higher orbit results in weaker downlink. Didn't hear it at my QTH during what should've been a good pass today.
RS16 - don't know the operational status of this one.

Would appreciate any help.

73,
Joe, WB9GOJ

From

http://www.amsat.org/amsat/news/ans.html

RS-12

Uplink 145.910 to 145.950 MHz CW/SSB
Downlink 29.410 to 29.450 MHz CW/SSB
Operational, mode KA.

RS-15

Uplink 145.858 to 145.898 MHz CW/SSB
Downlink 29.354 to 29.394 MHz CW/SSB
Semi-operational.

RS-15 has apparently lost its TLM beacon, however the transponder remains
on and working.

Great birds, lots of fun!

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* PHASE III-D NEWS *
====================
The prospects of having the Phase III-D amateur radio communications
satellite launched this year from a European Space Agency "Ariane" flight
have dropped to zero. On 1998-Jun-15, it was announced that a dummy
satellite representative of Eutelsat's W2 spacecraft would be flown along
with ESA's Atmospheric Reentry Demonstrator (ARD) on Ariane flight 503,
now officially targeted for "Mid-October". The Phase III-D satellite will
not be carried on flight 503, despite the numerous assurances given to AMSAT
over the past several months.

According to a recent "go-Ariane" report, when questionned as to the reasons
that had led to broken promises to AMSAT, Arianespace Chairman Jean-Marie
Luton fully explained the situation in terms of urgency. "We had to
constitute a pairing, the ARD and another payload within the allowable
mass limits. After the fire that damaged W1 which had been scheduled on
503, the fact that the sister craft W2 would not be ready and our inability
to find an alternative commercial passenger, we decided to have a dummy
satellite that was as dynamically representative as possible of a W series
satellite - and that without having to start all the studies from scratch
which would have pushed back the launch. If AMSAT had been accepted, the
launch could not have taken place before the end of the year."

AMSAT was officially notified that AMSAT Phase III-D cannot fly on Ariane
flight 503 "because it would take 8 months to fullfill the necessary
studies." AMSAT is now considering its future options for the Phase III-D
spacecraft, and does not exclude a solution to be found with Arianespace.

* FUJI-OSCAR-29 NEWS *
======================
According to an announcement made by the FO-29 command station, bit errors
were detected again on 1998-June-08, and the on board computer was reset

1998-Jun-09. Investigation into the bit error problem continues.

Controllers are asking that groundstations monitor channel "2A" in FO-29's CW telemetry. Channel 2A is the fifth item after "HI HI", and is usually reported as "00". Reports should be sent to: lab@jarl.or.jp.

[Info via Kazu Sakamoto, JJ1WTK]

* OSCAR-11 NEWS *
==========
During the period 1998-May-16 to 1998-June-14, reasonably strong signals have been received from UoSAT-OSCAR-11's 145.826 MHz VHF-FM beacon. The satellite was not monitored between 1998-May-27 and 1998-June-10. However, there is no evidence of ground control operations, and it appears to have been another uneventful period.

Telemetry continues to be nominal. The battery voltage has tended to rather low levels, averaging 13.5 volts, with one value of 13.2 volts observed.

The internal temperatures have fallen by about 2.5 C to 2.2 C and 0.6 C for battery and telemetry electronics respectively.

A single WOD survey of channels 1, 2, 3, 61 (magnetometers) dated 1998-Mar-19 has been transmitted. A quick plot of this WOD showed reasonable agreement with the theoretical field, and nominal attitude. Anyone using this survey should note the unusual starting time of 16:00:05 UTC.

Reports of the OSCAR-11 Mode-S beacon have been received from Roger W3SZ, Jim AF9A, Micheal OH2AVE, and Jack W9JIU.

The operating schedule remains unchanged:

ASCII status (210 seconds)
ASCII bulletin (60 seconds)
BINARY SEU (30 seconds)
ASCII TLM (90 seconds)
ASCII WOD (120 seconds)
ASCII bulletin (60 seconds)
BINARY ENG (30 seconds)

The ASCII bulletin is currently a static message, detailing modes and frequencies of all the amateur radio satellites.

There are additional status blocks after each bulletin is transmitted, and between ASCII TLM and WOD.

The Mode-S beacon is ON, transmitting an unmodulated carrier, but telemetry indicates that it has partially failed and delivering only half power. This beacon is a useful test source for those testing Mode-S converters prior to the launch of P3-D. It is considerably weaker than DOVE, which should be used for initial testing. Any reports of reception on 2401 MHz would be most welcome, and should be directed to Clive Wallis at: g3cwv@amsat.org.

The 435.025 MHz beacon is normally OFF. However, it can sometimes be heard when the satellite is being commanded by ground control (ie. within range of Guildford, UK). When the 435 MHz beacon is transmitting, the 145 MHz beacon is normally OFF. The data transmitted is mainly binary.

Listeners to OSCAR-11 may be interested in visiting Clive Wallis's web site. The web site contains details of hardware required and some software for capturing data, and decoding ASCII telemetry and WOD. There is an archive of raw data (mainly WOD) for analysis, which is continually being expanded as new data is captured. Also included are some audio files containing examples of each type of data transmitted by OSCAR-11. Each one plays for about ten seconds. There are also examples of Mode-S reception. All the audio files are zip compressed, so that they can be played off-line. These should help listeners identify the various types of data, and give an indication of the signal quality required for successful decoding.

The URL is:

http://www.users.zetnet.co.uk/clivew/

[Info via Clive Wallis, G3CWV]

* TMSAT-1 NEWS *
================
The TMSAT-1 telemetry configuration file for DTLM is available on the UoSAT web site at -:

http://www.ee.surrey.ac.uk/CSER/UOSAT/amateur/tmsat/index.html

In addition, up-to-date news will be posted to this page as the mission progresses.

[Info via Chris Jackson G7UPN / ZL2TPO (HS0AM)]

* SEDSAT-1 NEWS *
==================
The news as of 1998-Jun-18 is that SEDSAT-1 has PASSED its vibration test. All three axes went fine. For each axis, an up/down sine diagnostic sweep, a body dynamics sine test, a random vibration test, and an other up/down sine diagnositic sweep was performed.

1. All modes were at constant frequency before and after the vibration (within a few Hz).

2. No modes had center frequencies below 65 Hz. The lowest frequency mode in the X and Y directions appears to have been rocking on the PAF, although there was not enough instrumentation to prove this. Assuming that is the case all SEDSAT body modes are above 95 Hz.

3. In the Z vibration which was expected to maximally excite internal components, designers could hear some distinct internal "buzz" and "hum" sounds at particular frequencies. However, everything passed functional tests afterward.

4. During the functional tests two anomalies were observed. First was unstable current readings from the internal main bus current sensor. This spontaneously disappeared after some operation. The second was reduced brightness and contrast in the PAL images after the X shake. It is possible this is due to a lens iris problem. Designers will do some analysis later but do not plan any opening of the satellite.

5. The shock test was scheduled for 1998-Jun-19.

6. Ground handling and GSE continues to be a problem. Designers were able to complete all required operations, but doubts were raised about several steps with the flight PAF that could not be fully resolved. The differences between the T-PAF used for vibration, the test PAF used for shock, and the flight PAF make the issue more complicated.

A really BIG thank you to everybody who has helped get the SEDSAT-1 design team to this point. Special thanks to Larry Berge and Mike Henderson at Boeing, Mike Goeser at Goddard, Christine O'Neill at JSC, Marion Thompson at KSC, Jim Harrison at Marshall, and the whole staff of the vibration lab at Marshall who've been putting up with abortive tests and every changing PAFs for quite a while.

1389. Which radio??

Newsgroup: rec.radio.amateur.space
Date: 1998-06-22 00:00:00 UTC
From: Gerald Taylor <getaylor@telepath.com>
Message-ID: <358DAB18.9F479C22@telepath.com>
Source record: 15969

I am considering the purchase of a new radio to work the sats. The Kenwood TM-790A is on close out and a pretty good price. Also it has 1.2gig option. Other radios being considered are Yaesu FT736R and Icom 821H.

Any one have any experience with these. I am particularly interested in the computer interfacing (how user friendly) and doppler tracking quirks. All input is appreciated.

1390. Re: Which radio??

Source record: 15970

Well, for some odd reason, the Yeasu Engineers did not put in a way for a computer to read the current freq. dialed up on the FT736R and the FT847.....bad move. So any Doppler correction is either manually dialed in or the PC has to handle all the 'Tuning around the band' so it knows what freq. your on.

The 821 would be a snap to program for. The Kenwood may be as easy, I just don't know.

It's time for a lawsuit against ESA & Arianespace to force them to return money paid by AMSAT for a launch which it never received.

Anyone looking for a launch? Stay away from Arianespace, They'll SCREW you!

ESA + Arianespace = FRAUD

1392. Re: Its time for a class action lawsuit against Arianespace & ESA!

This isn't a very good idea. Who else is going to launch P3D for $1M? It isn't productive to alienate the commercial space industry. We don't have the money to pay full-fare, so why waste *any* of it on vindictive litigation? Maybe the lesson we should be learning is that we should be launching microsats instead of room-sized birds like P3D. Anyone look at the contract with Arianespace and ESA? Does it stipulate a time-limit?

AMSAT paid somewhere between $200,000 and $500,000 for a launch (down payment). It would be nice if they could get that money back. I don't think Amsat will press the issue though because they haven't got much money right now and lawyers cost money.

I'd like to hear some GOOD news from AMSAT for a change.

That is so silly ... if every ham in the US (600,000) sent E.S.A.
$16,500 it would still not be enough money.

Umm... by my math, 10,000,000 / 600,000 = 16.67 per ham. Heck, twenty bucks a head isn't bad. Most people spend more than that on random things every month. Why not send in $20 and let your money make a difference?

The $700,000 paid as down payment is available to be returned any time.
However, leaving it in escrow with Arianespace strengthens our hand in
any possible future legal action, or hardball negotiations.

Hello!

As title says, I'm in the market for a YAESU G-500A or similar elevation rotor. Mine got stuck some time ago. It has some damaged gears, so a parts unit with good gears could be also an option.

Please, e-mail directly your messages, stating condition and price.

Thanks!

Best regards.

Arianespace is the real one. ('espace' is French for
'space', so the name works both ways as is - the only
difference of pronunciation)

-JJ

1407. Re: FT-847 Freq read in? Problem?????

Newsgroup: rec.radio.amateur.space
Date: 1998-06-23 00:00:00 UTC
From: Christopher Cox <cobox@netexp.net>
Message-ID: <01bd9eea$ccaa7160$b160b6cd@cbx-nt>
Source record: 15841

At present there is no way to query any of the sets frequencies. So to set up a automated Doppler shift program ALL the tuning must be done via the computer.

With a ICOM for instance, the PC can query the receive frequency dialed into the rig and adjust for the Doppler shift for you.

I really like the FT-847, but this is a rather large flaw, IMHO.

1998 ARRL and TAPR Digital Communications Conference
September 25-27, 1998
Chicago, Illinois (minutes from O'Hare Airport)

Web: http://www.tapr.org/dcc

It's that time again! Mark your calendar and think about what to publish for the upcoming 17th Annual ARRL and TAPR Digital Communications Conference. This is the third year in which the ARRL Digital Communications Conference and TAPR Annual General Meeting are joined into one conference!

The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies, who meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The Digital Communications Conference is not just for the digital expert, but for digitally-oriented amateurs at all levels of expertise.

The 1998 ARRL and TAPR Digital Communications Conference will be held September 25-27, 1998, in Chicago, Illinois. This year's conference location is the Holiday Inn Rolling Meadows, just minutes from O'Hare Airport.

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes APRS operators, digital networks, software writers, modem designers, and digital satellite enthusiasts. The ARRL and TAPR Digital Communications Conference is for all levels of digital operators -- a must conference to attend to become active on a national level. Now, more than ever, amateur radio needs this great meeting of the minds because it is important that we demonstrate a continued need for the frequency allocations we have by pushing forward and documenting our achievements. The ARRL and TAPR Digital Communications Conference is one of the few ways to record our accomplishments and challenge each other to do more.

A Conference for the Beginner, Too

The conference is not just for the digital expert. This year's conference again provides multiple session tracks for beginning, intermediate, and

advanced presentations on selected topics in digital communications. Topics will include APRS, satellite communications, TCP/IP, digital radio, Spread Spectrum, and many others. Come to the conference and hear these topics presented by the experts! Don't miss this opportunity to listen and talk to others in these areas.

Symposia and Seminars

In addition to the presentation of papers on Saturday, three symposia/seminars will be held. These sessions are provided to allow those with additional time and interest to make the most of the Digital Communications Conference. For those who may have interest in just one symposium or seminar, registration for the conference is not required to attend these activities. This allows maximum flexibility for those who may want to participate during the Digital Communications Conference, but do not have an entire weekend to devote to the event.

The Second APRS National Symposium will be held on Friday and will be moderated by Steve Dimse, K4HG (the developer of javAPRS). It will likely include many APRS software authors, such as Bob Bruninga, WB4APR (the father of APRS), Keith Sproul, WU2Z, Mark Sproul, KB2ICI (the developers of MacAPRS and WinAPRS), Brent Hildebrand, KH2Z (the developer of APRSPLUS), and other nationally-known APRS leaders. Join this group for the afternoon and evening for in-depth discussions and presentations on the current and future status of APRS. This is a unique opportunity to gain insight into this fast-growing digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning System).

Starting late Friday afternoon, a half-day seminar titled "Infrastructureless Technologies in Amateur Radio," presented by Don Lemke, WB9MJN, will cover the pros and cons of DDMA (directivity division multiple access, a proposed infrastructureless technigue) versus hubbed (cellular style) and other infrastructure dependant techniques, the basic problem of megabaud rate communications into the ham QTH, and some techniques for channel-area acquisition including full duplex/asynchronous versus simplex/synchronous radio/acquisition concepts. This seminar will start late enough on Friday afternoon to allow those flying that day to attend the seminar.

The Sunday morning seminar will be a combination of two different talks that will make one excellent seminar. The first presentation, by Lyle Johnson, WA7GXD, will focus on the upcoming RUDAK digital communications system scheduled to fly on the AMSAT Phase 3D satellite in the near future. Lyle will discuss features, systems design, integration, and experiments. The goal of the presentation is to zero in on the communications capabilities of RUDAK, the performance to be expected from the 153k6 PSK system, the limitations and capacities of the DSP modems, user requirements for receiving RUDAK, requirements for transmitting to RUDAK, and how amateurs can work to make ground operations a reality once the satellite is in operation. Information on how to submit a proposal for experimental

time on RUDAK will be presented. The second presentation will be by Tim Shepard, KD1KY, regarding "Packet Radio Networks with Millions or Billions of Stations." This talk will present concepts and materials that make you think about different possibilities of networking in the future. Both Lyle's and Tim's presentations focus on different aspects of future digital communications possibilities.

Third Annual ARRL and TAPR DCC Student Papers Award

ARRL and TAPR especially welcome papers from full-time students to compete for the third annual student papers award. Two $500 travel awards may be given, one in each of the following categories: a) best technical/theory-oriented paper by a student, and b) best educational or community-oriented application paper by a student. The paper should relate directly to a wireless digital communication topic (see the guidelines for more information). Papers co-authored by educators or telecommunications professionals are also eligible for this award as long as a student is the first author. The deadline for receipt of finished student paper manuscript is June 20, 1998. Please note that this deadline is different from the general conference paper submission date. For full details and paper guidelines contact TAPR or browse to http://www.tapr.org/dcc.

Call for Conference Proceeding Papers

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the conference is not required for publication. The primary purpose of the conference is to communicate ideas and techniques regarding digital communications. Papers written in an informal style are welcome, as well as those written to academic standards. If you know of someone who is doing great things with digital communications, be sure to tell them about this! Papers are due by August 15, 1998, and should be submitted to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111, or via e-mail to lweinberg@arrl.org. The paper submission guidelines are available on-line (http://www.tapr.org/dcc).

Local/International Co-Host

The 1998 ARRL and TAPR Digital Communications Conference will be co-hosted by Chicago Amateur Packet Radio Association (CAPRA). CAPRA is one of the oldest packet radio groups in the US. It focuses on education about amateur packet radio, coordination of joint efforts of hams interested in packet radio, and technical and equipment support for a sound packet network in the Chicago area. They have had high-speed packet networks operational since the mid-1980s. Visit the CAPRA Web site at http://www.imaxx.net/capra for more information.

PRUG (Packet Radio User Group of Japan) will be the first International co-host of the ARRL and TAPR Digital Communications Conference. The conference is proud to welcome PRUG as part of the conference. PRUG will be hosting an informal social Friday evening after the seminar and symposium are completed. Visit http://www.prug.or.jp for more information about the organization.

What can you expect during the 1998 ARRL and TAPR Digital Communications Conference?

* A full day of papers, breakout sessions, and selected topics on Saturday for the beginner to advanced amateur digital enthusiast.

* Three seminars/symposia
Friday (1 PM)
- Second Annual APRS National Symposium,
moderated by Steve Dimse, K4HG

Friday (3 PM)
- Infrastructure Technologies in Amateur Radio
conducted by Don Lemke, WB9MJN

Sunday (8:30 AM)
- RUDAK Future Operations and Experimentations
by Lyle Johnson, WA7GXD
- Packet Radio Networks with Millions or Billions of Stations
by Tim Shepard, KD1KY

* Third Annual Student Paper Awards.

* TAPR Membership Meeting

* A banquet with special guest speaker Steve Roberts, N4RVE, of Nomadic Research Labs. Creator of the Winnebiko and Behemoth high-tech recumbent bicycles. His current project is focused on Microship technology (http://www.microship.com/).

* SIGs (Special Interest Groups) get-togethers on Saturday, following the banquet

* Informal get-togethers throughout the weekend

* A facility that is perfect for this type of conference

* Informal engineering discussions/demonstration areas

* Motorola Museum located in the area.

* An event at which the most important new developments in amateur digital communications are announced

* Digital 'movers and shakers' from all over the world in attendance

---

Conclusion

If you have attended a Digital Communications Conference in the past, remember how much fun it was discussing the latest developments into the wee hours! If you have never been to a Digital Communications Conference, then make your plans now to attend and find out how much fun they can be.

There are few activities where your participation can be so much fun and so important! You will be able to get together with colleagues from all over the world and bring each other up to date on your latest work. Experience all this and more for an unforgettable weekend of ham radio and digital communications. Make your travel and lodging arrangements now. We hope to see you at the ARRL and TAPR Digital Communications Conference, September 25-27!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road #337, Tucson, AZ 85749-9399, phone 940-383-0000, fax 940-566-2544, e-mail tapr@tapr.org, browse www.tapr.org/dcc.

Sincerely,

Steve Ford, WB8IMY, ARRL Conference Co-Chair
Greg Jones, WD5IVD, TAPR Conference Co-Chair
Steve Stroh, N8GNJ, Conference Manager
Mark J. Thompson, WB9QZB, Local Host Liaison
Carl Bergstedt, K9VXW, Local Host Liaison

Note: If you need conference handouts or flyers for ham club meetings, contact TAPR to get what you need!

Hotel Information

Conference presentations, meetings, and seminars will be held at the Holiday Inn Rolling Meadows. Special DCC rooms rates are $85 per night. When making reservations with the hotel, be sure to indicate you are attending the ARRL and TAPR DCC in order to get the discount. It is highly recommended that you book your room prior to arriving. A block of 75 rooms is reserved until August 31, 1998. After the 75 rooms are booked, rooms will only be available in nearby hotels, so be sure to book your rooms early! The hotel provides transportation to and from O'Hare Airport. Please contact the hotel to arrange specific transportation needs.

Holiday Inn Rolling Meadows (conference hotel)
3405 Algonquin Rd
Rolling Meadows, IL 60008
Phone 847-259-5000, fax 847-259-0597

Registration

Contact the TAPR office by phone, fax, or e-mail (numbers and addresses are above) to register or for additional meeting information. MasterCard and VISA are accepted.

- Preregistration (before Sept 1): $42.00 *

- Late registration or at door: $47.00 *

* - Conference registration includes Conference Proceedings, Saturday sessions/meetings, and lunch.

- Saturday Evening Dinner (limited space): $20.00 **

** - Includes dinner, speaker, prize drawing

Seminar/symposia

Note: You do not have to be registered for the conference to attend one or more of the seminars/symposia.

- Friday, 1-8 PM, Second Annual APRS National Symposium (full day)

Registration: $25***

- Friday 3-7 PM, Infrastructure Technologies in Amateur Radio, conducted by Don Lemke, WB9MJN

Registration: $15***

Sunday 8:30-11 AM and 11:30 AM-2 PM, RUDAK Future Operations and Experimentations by Lyle Johnson, WA7GXD, and Packet Radio Networks with Millions or Billions of Stations by Tim Shepard, KD1KY

Registration $20***

*** Cost of seminar or symposium includes the cost of handout materials.

Contact TAPR to register for the DCC:

Jim, don't worry about Arianespace. Just set your SPAM err GUAM-SAT outside during TCOR1 and it will make it to the top of the atmosphere, at least. If you do this during Ozone Hole maximum, there is a good probability it will become space-borne. I saw this in the movie "TWISTER," so it should work OK with Typhoons. For the latest weather updates, check with Chip Guard or Frank Wells at JTWC.

Also because they might not have a chance of winning. The ESA and
Arianspatal (sp? The real, French one not the anglisized version)
have, as you point out far more money to spend on lawyers. They
would be in a good position to write in loopholes that AMSAT's
lawyers might not have noticed or taken seriously enough. So it's
quite possible that AMSAT signed a bad (from their point of view)
contract, and don't have a good basis for suing.

Hello!

As title says, I'm looking for a control box for the Yaesu G-400 rotor.
I want the 'S-meter' style, not the 'circle' style (which I already
have).

Please, e-mail any offers directly.

Thanks!

If you mean amateur geostationary satellites, the idea has been
considered, and rejected. The problem is primarily financial:
if a satellite is parked over the Americas, it is not useful
to European hams, who are then reluctant to contribute money
and other support for its construction. And vice versa (and
don't forget Oceania). There was discussion in the 1980s -
look for terms like "Phase 4" and "Amstar".

If you feel the issue should be revisited, go for it. Some
of the very best ideas - indeed, the amateur satellite program
itself - have come from a person asking "I wonder if..."

1425. Arianespace to Launch Dummy Payload - Why not a hamsat?

Newsgroup: rec.radio.amateur.space
Date: 1998-06-25 00:00:00 UTC
From: wb4lnm@aol.com
Message-ID: <1998062517100000.NAA17791@ladder03.news.aol.com>
Source record: 15855

This weeks issue of Space News says Arianespace has not found a taker for its next test flight of the 5 series despite cutting its launch price in half.

So, it says they "...would carry a dummy payload designed to simulate a commercial satellite."

Gee, what a loss of a great opportunity to throw a big amateur package into space. Heck, it could be (just kidding now) a block of car batteries and an ICOM repeater. Who cares if it only lasts for a month or two?

What a shame we did not exercise our connections to launch something.

Rejected by whom? I seem to recall at the Toronto Symposium that both
Bill Tynan and Phillip Chien proposed geosats in two papers
that I can recall.

What are AMSAT-NA's plans post-P3D? I checked the
AMSAT web site, but there doesn't seem to be too much
a propos future plans.

Hello all. I have a one year old FT-290RII 2mtr SSB rig with a new in the box (with receipt for warranty) B310G 100w amp for sale. I have the manuals and the box for the 290. The amp is one month old. Asking 600 OBO. The 290 has the tone board and was bought new from AES July of 97. All boxes, all manuals, and I just had it taken to Yaesu to have it checked out and realigned for selling(have paper work, nothing replaced. Checked OK!) Great for the 2 meter opening and DX work on 2. Very fun!

No new major satellite effort will be made by AMSAT until P3d is launched. There are many ideas under consideration, including a constellation of 3 Medium Earth Orbiting satellites, possibly with interlinkage, another P3d in a different orbit to give basically 24 hour coverage over most of the northern hemisphere, a pair or geostationary's, and a constellation of LEO's. However, we have a serious problem now just finding a ride for one satellite, albeit a relatively heavy one.

My gut feeling is that if we can't get this one launched, then any further fund raising efforts for other new AMSAT satellites are probably doomed. That is why I am favor of strong international political pressure on Arianespace and ESA to honor their written and verbal contracts with AMSAT. For those German and French amateurs who read these posts, I encourage you to get in touch with Dr. Meinzer and see what you on the continent can do to make this thing happen. The future

of the amateur space program may hinge on it.

Figure out how to raise the money. We could put P3D in GEO if we
had the money for the launch to put it there.

I don't want to see P3D in a regular geosynchronous orbit; the one that is
proposed could serve many more amateurs. That orbit is quasi-geosynchronous
in it will appear in the same place in the sky over the period of a week or
so. Folks may be able to have fixed antennas and have hours of operating
time apogee. And if it is able to do that over in several places, then many
more folks will be served. Note that there are folks who have earned DXCC
via satellite, and i don't if that will work as well in a geosync. orbin.
And while it hasn't really been discussed, it also occurs to me that at the
perigee, folks with less sophisticated equipment would get at least some
operating time, albeit quite brief by comparison. So i believe the proposed
P3D orbit will serve a much larger community than one (or maybe even several
geosync. birds).

> I tink there is barrier between freebies and pay thru the nose,
> in regards to size. I wonder if we are at that barrier???

It's obvious that finding a cheap launch for a little satellite is easier than finding a cheap launch for a big one. This doesn't rule out cheap launches for big satellites; it just makes them harder to come by.

There a number of such projects out there, and often one ends up with a package that has both educational and/or scientific value, as well as providing resources to the amateur radio community. And in turn, we handle some of the communications aspects of the project. Someone has remarked that NASA doesn't launch amateur satellites anymore. Perhaps it doesn't do that for purely amateur payloads, but it has participated in some of these combined payloads. But looking over the microsats over the past five or ten years, it seems that ESA has launched the vast majority of those satellites. Many are combined payloads, such as the very busy AO-27/Eyesat-1 satellite. We do have two of these combined payloads going up fairly soon, SEDSAT-1 (another Mode A bird) and ASUSAT (whose amateur operation should be similar to AO-27). TMSAT-1 is another, and it's doing something innovative, that is, a full-scale test of 38.4Kb packet operations in space.

I feel the way to get things launched is to do innovative things and/or in partnerships with scientific and/or educational projects. If we do things with satellites that will have value to others (be it research, educational, scientific, public relations, or just plain simple cooperation), then they will get launched.

Yes, it's good that someone is concentrating on multi-purpose amateur satellites, and that's a good thing for AMSAT to be doing. But perhaps the next project should be less of an all-purpose satellite, if nothing else, to get the size down to where it's easier to find room on a launch vehicle and where we won't be asking as big a favor to get it off the ground.

A point well taken. Nonetheless, a small constellation of , say , at least 2 (3
if funding available-very doubtful) geoSTATIONARY sats could be launched in
rapid succession to cover the globe almost completely! Surely this should be a
TOP priority post-phase3D at ALL Amsat chapters. Just a thought, but one whose
time has come,IMHO.

I don't know much about ham..I'm kinda new to it...(i haven't gotten my liscense yet) but, I do know this....you could launch ONE geo over america and be able to interlink it with the smaller sats just out of the horizon for other people....with time, you could get another geo and then you'd have to geos that would allow improvements to the itty-bitties.....

Humor aside, I thought that was what P3D provided. I guess they are looking for something to be put geo-stationary.

Launched with what is the usual question - we already have one satellite that is still sitting on the ground for lack of a launch. We also already have a funding problem for that one satellite.

Getting there wouldn't be too much of a problem - the launch we want for P3D is a geosynchronous transfer orbit. Burn at apogee and you're there.

Operationally, a geosynchronous satellite would require much more involved management than previous satellites - without precise stationkeeping, you lose the advantages of the orbit.

This is also a fairly busy part of space (especially over Europe and the Americas), and obtaining an orbital slot - even a shared one - could be a non-trivial task. Like the situation with our secondary payload launches, we'd have to convince our neighbours in space that we weren't going to do anything crazy to their satellites.

Ham radio is on the trailing edge of new technology. Besides, it costs a ton of money to get ANY kind of satellite up there. Maybe when we get a new generation of hams that are in sync with the current decade (instead of the current bunch of code keepers), we will get back to the cutting edge.

From ARRL Headquarters
Newington, CT June 26, 1998
To all radio amateurs

SB SPACE ARL ARLS010
ARLS010 SAREX will not fly on Glenn mission

NASA has scuttled plans to include the Space Amateur Radio Experiment (SAREX) payload aboard STS-95 this fall. That's the flight that will carry US Senator and astronaut John Glenn into space. Five schools, four in the US and one in Japan, had been tentatively lined up for Amateur Radio schedules to talk with the shuttle crew during the highly publicized October mission. Glenn, the first astronaut to orbit Earth, will be 77 when he returns to space later this year.

NASA flight managers also removed nine other ''secondary'' payloads because of time constraints on the already-busy mission. NASA expressed regret at having to drop the educational SAREX payload.

Two hams--US Astronaut Scott Parazynski, KC5RSY, and European Space Agency astronaut Pedro Duque, KC5RGG, of Spain--will be among the international crew aboard STS-95.

''We're really disappointed,'' said ARRL Educational Activities Department Manager and SAREX Working Group Member Rosalie White, WA1STO. The Glenn flight had generated a good deal of enthusiasm within the ham radio community. Schools to be included had only recently been notified that they would be on the list. White said the US schools involved now will be first in line for consideration on future missions, such as STS-93 early next year and the International Space Station.

Future shuttle missions are heavily loaded with activities involving construction of the ISS. Eileen Collins, KD5EDS, the commander of STS-93, is said to be enthusiastic about the possibility of including SAREX on her flight. Amateur Radio also is an official payload aboard the International Space Station.

While the geosynchronous orbit is not stable, thus requiring some station keeping fuel to be used to maintain the exact position (and limiting the operational life time) of a commercial communication satellite, this is a minor problem for amateur satellites. My understanding of the orbital mechanics is that the satellite will wander a few degrees (in a figure of eight path) around a nominal position without station keeping burns. However, the beam width for a 10 lambda diameter parabolic reflector is about 6 degrees (about 25-30 dB gain), so for most practical ham antennas below 5 GHz, this would not be a problem.

"Orbital slots" are just a frequency management concept determined by the beam width of ground station antennas. The weather satellites are not affected of the communication (TV) satellite slots, since they are operating on different frequency bands. Unless we have several geosynchronous amateur satellites operating in the 145.8-145.0 MHz and 435-438 Mhz orbital slots are not going to be a problem.

is there some way we could think of to sell advertising on P3D so we
could raise advertising venues [via P3D] to pay the $10,000,000 needed
for the launch?

While P3D is big by amateur standards, it hasn't the mass or balance of a
commercial comsat.

I am looking for a program called Nova for Windows for tracking satellites. Does anyone know where I can get a copy. I'm not sure if it's share or what. I saw it at the Space and Science Centre in Edmonton AB.

Thanks
Steve VE4FX

Then can't they just add a second piece in addition to P3D that would
add the required mass and balance?

I think "they" explained that this could be done, but not in the timeframe
they allocated for it.
This Ariane 503 has to be launched soon. The credibility of the Ariane 5
programme is at stake. The delay because of the commercial customer loss
is such a big problem to them that they won't replace it with a delay to
build a new dummy that somehow incorporates P3D.

There was a proposal to use land-based lasers to launch small payloads to Earth orbit. Would it be possible to have space-based lasers for station-keeping maintenance? You probably would not need too many of them if they were accurate enough. Might not be feasible due to current sats not setup to be moved that way, or its too far to aim accurately, or you might hit stuff enroute but the advantage is that the station-keeping is not done by the sat itself - no fuel considerations.

Or: a robotic solar-sail craft whose job it was to patrol the sats, and when one needed a change to "hook it" and and make that change. I have no idea how to do such a thing, but it would be cool!

Arianespace needs to be told "politically" that this is not acceptable,
and that they should "hold" if necessary to honor their AMSAT
committments. You hams on the continent, get busy with Dr. Meinzer.

Yep, that's about the size of it. Arianespace ate $40M in development
cost sharing so that they could get off quickly. They *need* a successful
launch, and they need it soon, to maintain credibility for this program
with their commercial customers.

Though I am intensely disappointed that we got bumped, I hope that they
have a textbook perfect launch of 503. That will take a lot of pressure off
of them and allow them to work to accomodate us on a later launch.

I think AMSAT should tell ESA that if P3D does NOT fly on 503 that hundreds of thousands of hams around the world will start an email campaign against ESA telling potential commercial customers to NOT fly with ESA because they do NOT protect their clients. These emails should also go to all government agencies and political governments involved with funding ESA.

Lets wait until 503 flies ... if we are not on ... then start the mail.

It's more than a few degrees (14 degrees inclination for ATS-3, the
usual example of such an orbit). The 64 million dollar question: if
you have to track it anyway, what advantage does such an orbit have
over P3D's intended Molniya orbit?

> "Orbital slots" are just a frequency management concept determined by
> the beam width of ground station antennas...

While they are a result of antenna technology, they are there, and
must be dealt with - even if only to make sure that they aren't
an impediment to an amateur launch. I found some discussion of
this in Larson & Wertz (chapter 21), where it is listed under
"Specific Problem Areas". I would hope that an amateur launch
wouldn't require five years of approvals, but at least we'd have
time to line up a launch. :-)

Doing such childish things certainly is not going to help. It will just
ruin the reputation of radio amateurs and amateur satellite builders, both
within launch agencies and within governments.
Just what we need now that governments are tempted to sell of amateur
bands to commercial users.

It seems that the US amateurs in this group have an enourmous bias against
European launch agencies. They tend to forget that NASA has not launched
any amateur satellite for ages.

Marconi's transmissions were about 100 years ago, so they have travelled 100 light years from Earth. If somebody was 50 light years away and replied immediately, we would hear their replies now. The signals won't reflect unless there is something to reflect them back to us.

Unfortunately, even the most powerful radio transmitter we have today, coupled to the largest antenna we have today (say, a couple of megawatts into the Arecibo dish) would be difficult to hear at interstellar distances. Much to the chagrin of the SETI folks - though I'd be delighted if they succeeded.

Unless the systems at Clavius are still online, it's unlikely anybody else heard Marconi... :-)

Word in I.S.I.R. is that EUTELSAT has written off the F1 bird after it drowned
in a fire in a testing chamber. During a full power test, a fire of unknown origin
began in the chamber wall spaces(anechoic insulation), the sprinklers tripped
while the s/c was under full power. The effects were rather dramatic.

suspicion is the microwave power beam burned the chamber walls.

at any rate, the s/c is a total loss. as a result, and here's the big news

EUTESLAT has pulled F2 off the Ariane 503 qualification flight, onto a 44L. Leaving open the 503 flight.

Ariane is rapidly hunting for replacement customers, but have three major
options.

1) Amsat Phase 3D.

2) fly F1 as an engineering payload, after stripping what salvagable parts and re-configuring.

3) Fly marcus lindroos ;-)

Collisions are really not an issue. As long as you are in a separate
frequency band, there is nothing to coordinate.
Normally we should be, unless we choose a band that is shared with other
satellite users.

(note that tv sats are, at least over Europe, often co-located. i.e.
several sats, each with a limited number of transponders, are located
at the same orbital position. this provides consumers with more channels
without moving the antenna. those satellites don't collide either)

We don't have contracts with NASA. We DO (did?) with Arianespace. I
would recommend the same negative political exposure if this problem
were NASA, or Kruchnikov Industries, or Long March Industries, or anyone
else. A contract is the same in any nationality or language. At least
NASA has been up-front in telling us they really don't have a ride for

us, and don't want us. But that's another problem.

When it becomes obvious that the 503 is indeed going up without us, I believe that is the time to try to produce intense political pressure, and worldwide negative publicity to shame these people into honoring their committments.

:
: It's more than a few degrees (14 degrees inclination for ATS-3, the
: usual example of such an orbit).

Interesting that you brought up this more than 30 year old satellite. So, the orbital disturbances are indeed cumulative. However, looking at satellites that have been without station keeping for shorter times, it looks it is more like 5 degrees/decade, which would be a more realistic life time for the electronics. A station keeping burn every other year should keep the orbit quite stable anyway without constant position monitoring.

: The 64 million dollar question: if
: you have to track it anyway, what advantage does such an orbit have
: over P3D's intended Molniya orbit?

Look at the ATS 3 orbit from North America, the azimuth does not change much, only the elevation changes. If tracking is required for some narrow beam microwave antennas, only the elevation control is required. For lower frequencies, an array of yagis mounted in the East-West direction would produce a wide beam in the elevation direction, while the beam would be narrow in the azimuth direction. For microwave bands a similar antenna as used in maritime radars could be used.

There has been a lot of speculations about the P3D orbits, but it seems that a full control in both azimuth and elevation would be required to track it. It seems that it would too difficult to design any equatorial mounts that would be easier to handle mechanically and do the tracking in one dimension only (equatorial mounts have been used in astronomical telescopes for centuries and are also useful for tracking satellites in the geosynchronous satellite belt).

No, unfortunately Pat, they do have another option. That is to fly the Eutelsat dummy mock-up, to verify commercial launch configuration. I believe that they have stated that is the plan, just in the event that the actual satellite can't fly.

well here in the USA what ESA is doing (what I have read is that they promised to launch us for less than $1,000,000 but now they want 10 times that amount. here we call that practice "Bait and Switch" which is illegal and criminal action. maybe we can file some action against ESA through the UN?

AMSAT was a client of ESA [even though a low cost one [one might even say a charity ... since we are a non-profit organization] so I see no reason why we should not tell other potential clients how ESA treats their clients [if we do not launch on 503] and charities.

If ESA had told us up front that they would not launch us for less than $10,000,000 then of course we could not have gone with them, but rather would have searched for another launch agency [which it would seem we now must do] and plan for that launch vehicle [as we built our bird].

You are right. ESA did not say that they will try to get us on a
later flight ... [at our current price schedule] but they did say that
if they do that they NOW want $10,000,000 to launch us!!!!
Some kind of friends. With friends like that who needs enemies!

That would be real good advertising ... ESA flies [another] dummy bird while dumping on amateur radio operators worldwide, when they could have flown a REAL working satellite.

I guess the bottom line here is ... if you want to launch a dummy bird go to ESA ... if you need to launch a "Real" bird go somewhere else!!!!

THE NEWEST TESTAMENT:
Rock Prophecy, a book about the Hendrix / asteroid / Microsoft connection. Rock Prophecy defines the faith of a new religion, the original asteroid prediction of Jimi Hendrix which triggered an avalanche of asteroid stories in recent media. The manuscript interprets history in ways that dominators are most concerned to obstruct and crush. The story reports Microsoft's connection with the end of civilization. Please visit the Rock Prophecy page:

http://www.geocities.com/SoHo/Gallery/8199/prophecy.html

Help us preserve and protect the Newest Testament. Help us spread the word about this vision.

1486. Portable, homebrew 440 Mhz Yagi for AO27?

Newsgroup: rec.radio.amateur.space
Date: 1998-07-01 00:00:00 UTC
From: Ken Harris <kjh@shoreline-studios.com>
Message-ID: <359AEE6E.41C6@shoreline-studios.com>
Source record: 15767
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.space

I'm interested in building a simple, cheap, portable
antenna to work AO27 (Uplink 145.85 MHz FM, Downlink: 436.792 MHz
) from my bicycle (and FT50).

I guess I need some gain at 440Hhz... the satellite
puts out less than a watt. The FT50 puts out 5 watts, so
I don't need any gain at 145 Mhz.

It seems amazing that so few hams give Arianespace any credit. They are
launching the satellite for considerably less than any other agency would.
It is hardly suprising that they will not accomadate delays to integrate
P3D payload requirements to fill a slot, given the expense of delay and
their credibility problems with real, paying customers.

Let's face it folks, when you beg and plead, you can't be too picky.

What exactly is the satellite module for the ic-706? Concidering the radio doesn't do 70cm, it can't be for the most of the most current birds. Could it be a way to do out of band splits for modes A,K,or T??

Any info would be nice,

Matt C.

Sure, if you like tuning the TX and RX freq's by hand. Believe me, it
sucks big time. Actully, I think I found out what it does.

It's called a satellite interface module (CT-16). From what I can tell,
it tracks your uplink and downlink freqs together, keeping you from
having to do it by hand. But I am not sure if works in tranciever
packages or with seperate transmitter and receiver (it something to do
with the CI-V bus, which allows multiple radios to communicate with each
other). Anyhow, if anybody can elaborate on this, please do so.

Politeness is always a good policy; so is optimism and patience. Besides,
when you are dealing with something as scarce as space launches, you have
to keep things in perspective. Complaining will get you far less than if
you think of reasons to motivate the other party. Think of what you can
do for them; don't complain.

Ken, it is *possible* to work AO27 with a dualband vertical
and a HT, but it certainly isn't easy. You need some gain
to make solid contacts. The Arrow dualband handheld beam
works well. It only takes a few seconds to assemble, so it can
easily be used from a bicycle (not while you're riding the bicycle,
of course). It is also slick for use while hiking or camping.

The FT50 will also work, but it isn't ideal. A FT51 is better.
You want to be able to hear your downlink while transmitting
(use an earphone). You can't do that with the FT50, but you
can with the FT51 (and a diplexer). I actually use a pair of HTs,
a VX1R for receive and a Tech America $99 special DJ190
for transmit. (I run the DJ190 off a gel cell belt pack to get
full output.)

I can't capture the satellite away from base stations running
power, of course, but I am solid into it with the Arrow beam
and 5 watts when they shut up for a moment. (That's why
you want to be able to hear the downlink, so you'll know
when you've got the satellite.) Receive signals are about S7
using the 5 elements of the Arrow antenna for receive. The
pass has to be very favorable to hear it well on just a vertical.

A friend of mine added a GASFET preamp for receive because
his HT is a little deaf in the 430 MHz band (a Kenmore something
or the other). But my VX1R does just fine. The FT50R should too.

Actually I find the tuning quite easy. The disadvantage of the early
706 is that it won't cross band, the MkII will. Working RS-12 is quite
easy if the other station chases your Doppler.

The CT-16 has nothing to do with the 706 MKI or MKII it is used the the
Icom 2M and 70cm all mode transceivers IC-271 471 etc. It ties those
type radios together for satellite work.

True Gary but the MkII can crossband and since the Doppler effect is
not all that great on the RS birds I use my MKII to work RS-12 rather
easily. What I did was to work RS-12 with my FT-736 to get a feel for
the Doppler then I just use approximate settings with the 706. I'll
have to look for you on AO-27 I'm on there a lot usually from strange
places.

Went camping eve of July 4th at 9000ft elevation. Was star
watching from about 2am to 4am counting satellites.

Total count was 17 !!! Never done this before and quit surprised.

There was a very interesting tight nit trio of satellites
that went by in perfect step at about 2:40am.

I've determined two of them were MET 2/19 and MET 2/21,
but can not find out what the third satellite was.

Can anybody tell me?

How big are they? How can you tell a satellite from a star? I was on the beach last night and I think I saw one but wasn't sure.

Drew / Charleston S.C.

I'm a backyard astronomer wondoring about radio astronomy, can it be done or does it involve lots of cash and a huge dish. Any suggestions?

They look like any other star, but move rapidly and at very
constant speed. They all move at exactly same speed, so once
you have seen one, you will instantly recognize the next as
a satellite.

Even if phase 3d could be ready for launch tomorrow, Arienespace wouldn't
launch it because the execs at Arienespace are assholes.

Last I heard, phase 3d is about ready for testing.

Radio Meteor Observation Bulletin No. 59 July 1998

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Barcelona, Spain (01 59' E, 41 21' N)
Frequency: 48.250 MHz
Transmitter location: most likely Czech television C2 C. Budejovica,
100 kW, horizontal polarisation.
Antenna: 6-element Yagi 617-6B, 14 dBd gain.
astronomical azimuth 215 deg (=NE), elevation 0 deg.
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (100 Hz) and fed into the PC in real time.
Data sampling system: using a super 14 bits A/D card to PC/XT and
"Data Capture" software with 9 second/18 sampling interval to
store all the > 1.0 s signal increases.

Notes:
. nn? possibly affected by sporadic-E or FAI.

Enric Fraile Algeciras

Observer: Michael Boschat
Location: Halifax, Canada (63 36'W, 44 39'N, 58 meters above sea level)
Listening Frequency: 83.25 MHz
Receiver: Icom R-10
Antenna : resonant dipole
Antenna Direction: Horizontally polarized with lobes in E-W plane, elev 0 deg
Filter : high-Q (Q at least 300) bandpass filter between antenna & receiver.
Listening Mode: AM
Recording method: listening by ear

. I = Interference

Mike Boschat

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 deg (= E),
elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

June 1998

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

Notes:
. ? probably affected by sporadic-E, direct reception.
. local time = UT + 2 hours.
. thunderstorms on June 5, 21, 22, and 25.
. hardware or software problem on June 22-23
. * warning for relative high number of long duration reflections,
an indication for potential stream activity.
. & test on June 1 with antenna inclination of 35 degr, which dramatically
reduced the number of reflections (and hopefully also the amount of
interference)
. June Bootids activity on June 27-28

Maurice De Meyere

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 20 deg
Antenna amplifier: 10 dB gain
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).

Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

Notes:
. the unexpected June Bootids activity can be seen from June 27, 1h UT
to June 28, 12h UT.

The dip in the maximum activity centered on 7h UT gives roughly
a Right Ascension of 205 deg for the radiant (lower than any of the
visually estimated values) and a declination of at least 45 deg.
The low velocity and the resulting zenith attraction cannot be neglected
in this case. Estimation by Chris Steyaert using the FORWARD program.

Pierre De Groote

Observer: Will Kelsey
Location: Santa Maria, CA, USA (120 26'9" W, 34 55'38" N)
Frequency: 106.9 MHz
Transmitter Location: KEAR FM San Francisco, CA, distance 352 km
Antenna: Yagi FM 6 element, heading NNW.
Receiver: Sangean 803A
Observing Method: Listening to audio.

Underdense/Overdense Scale:
C-Dense: 0.5 second or less
B-Dense: 0.5 to 3.0 seconds
X-Dense: 3.0 seconds or more

Estimated Signal Amplitude (ESA): 1 to 99 maximum
Interference (INT): Lo Med Hi

Each observation hour is recorded in three 20 minute intervals

1998 hr-UT X-Dense B-Dense C-Dense ESA INT Total
June

Will Kelsey

Observer: Werfried Kuneth
Location: Ferndorf, Austria (13 37' E, 46 45' N)
Antenna: 2 element Yagi, direction southeast, no elevation at 1m height.
Receiver: IC-706 at 53.76065 MHz, CW-R mode, 500 Hz CW filter, fast AGC.
Transmitters: 1) 30 kW TV video carrier from Bari, Italy, distance 700 km,
direction south and 2) a 30 kW TV video carrier from Sicilia,
Italy, distance 900 km, south. The total echo power of both
transmitters is processed into same 40 Hz virtual
receiver channel.
Observing method: automatic setup using FFTDSP42t software by AF9Y to record
the audio signal. 20 channels of 2 Hz width are used for meteor

identification, pictures with interference, sporadic-E, E-layer
and FAI propagation are manually rejected. Sampling interval: one
4096 point FFT every 0.5 seconds.

The meteor counts below are corrected for a full hour observing time. If
the recording duration is 20-40 minutes, a dot is shown after the value, to
show the reduced accuracy. Results for less than 20 min. observing time are
excluded.

Counts of reflections longer than 3.5 seconds:

---+------------------
UT| 26 27 28 29 30
| June 1998
```

Notes:
. no other correction except for "dead time" is used in the counts shown.
. local time conversion: 2 hour ahead of UT (04h00 UTC is 06h00 local)
. outburst of the June Bootids on June 27 and June 28, marked with "*"
. lots of sporadic-e and FAI propagation throughout June. Contrary to May 1998, this month showed often continuous openings for several hours, which led to reduced meteor count recording time.

Werfried Kuneth

Observer: Chikara Shimoda
Location: Asahi, Nagano, Japan (137 51' E, 36 07' N)
Frequency: 81.4 MHz
Transmitter Location: FM-Japan 81.3 MHz, 10 kW, distance 180 km.
Antenna: 5 element Yagi directed to the zenith.
Receiver: AM-FM Tuner (TRIO KT-1100)
Observing method: Meteor echoes output from center-tuning meter were recorded on a pen-recorder chart.

2. ANNOUNCEMENT

IAU Circular No. 6954 mentioned visual and radio observations in Japan
on June 27.5-25.7 of a stream with radiant between eta UMa and alpha Boo.
On June 29, Peter Jenniskens, President IAU C-22 Pro-Amat Working Group,
gave a fuller account of the observations so far, including European visual
observations. More observations appeared on the meteorobs and IMO mailing
lists. Radio amateurs reported also activity on the VHFDX mailing list, not
necessarily recognizing the nature of the increased activity.
It looks that this unexpected stream of slow meteors (14 km/s) was active
at a level comparable to the maximum of the better streams (such as the
Geminids) from early hours UT of June 27 to midday June 28 UT.

3. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and it has gradually been expanded. In regularly publishing summaries of observations, potential radio observers are kept up to date of existing installations, possibilities and limitations of radio meteor observations. In the long run, there should be sufficient observing stations to cover the whole globe, allowing to detect stream outbursts which may remain unnoticed visually.

RMOB contains typically: summaries of recent observations, equipment data, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or un-subscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

In article <6ngtgc$o5$1@atlantis.pixar.com>, dated 2 Jul 1998 21:19:08 GMT, markv@pixar.com (Mark VandeWettering) wrote:

>It seems amazing that so few hams give Arianespace any credit. They are >launching the satellite for considerably less than any other agency would.

"They are launching the satellite..."?? I thought the reason that Arianespace was taking flak here in this newsgroup was because they were NOT "launching the satellite".

BTW, how many ham radio satellites has Arianespace launched for the ham radio community over the years? And is there a web site somewhere that lists all the amateur satellites that have ever been launched and gives details such as who launched each, how long each was active, what modes were available, etc.? Just curious. Thanks.

Message-ID: <35A26EE0.2132677E@gate.net>
Source record: 15792

I am trying to assemble an automated OSCAR station. I am familiar with the Kansas City Tracker, but don't want to dedicate a desk based computer to the project. I wish to use a laptop computer for control of both a Yaesu az/el rotator and compensate for doppler on an FT847.

I have found references to an AEA Trackbox (dead-end) and to a TAPR device (dead end there INCLUDING the TAPR site and kit section) Maybe I'm dense, but even with membership in AMSAT, I'm at a loss finding which software/harware combination will suite my needs.

I am interested in both analog modes and working the pacsats. Any help would be greatly appreciated from this down-in-the-swamps boy.

On the 4th or 5th? Time zone? Lat and Long? Az/El or RA/dec of sats.
Direction sats moving?

> I've determined two of them were MET 2/19 and MET 2/21,

How did you determine that?

Source record: 15795

Tobin Fricke wrote:
>
> We specify the orbits of artificial satellites using orbital elements >in the two-line format.. Where could I find the two-line elements for >the moon?

It wouldn't work that way. All of the satellite tracking programs assume that the mass of the satellite is negligible compared to the mass of the Earth. That's OK for man-made satellites, but not for the moon. The mass of the moon is about 1/80 the mass of the Earth, and the moon's gravity exerts a noticeable pull on the Earth. So your satellite tracking program can not produce accurate predictions for the moon. There are a number of astronomy programs which will predict the orbit of the moon.

1515. What birds use 2M / 10M?

Newsgroup: rec.radio.amateur.space
Date: 1998-07-08 00:00:00 UTC
From: Larry Brandt <lrbrandt@statestreet.com>
Message-ID: <35A39008.8BF5DF54@statestreet.com>
Source record: 15796

Hi All,

I don't know the mode I'm referring to but what Amateur satellites use 2M as an uplink and 10M as a downlink?

I've just bought a Kenwood TS-700SP and Mirage 160 Watt amp that should put out 100 watts all mode with the 10 watts that the Kenwood produces.

I also have a wide-band, 4 element, 10 dB gain 2M antenna that would be used.

I don't have any rotors or anything yet, just trying to get my feet wet. So I guess I'd be looking for birds that have an elliptical orbit. Or at least near earth birds that a ground plane and 100 watts on 2M on cw/ssb would hit.

I've looked at some satellite tracking software, but I wonder if there is software that shows the modes, beacons, etc. of the satellites. I haven't found any such software.

Thanks for your help all!

73,

Larry

They have launched many previous AMSAT sats, including AO10 and 13.
However, the issue is "what have they done for us lately"? We have a
(had) contract, that was broken. They should be billed for the
development costs of the SBS (I believe to be $15M), or provide us a
launch within 6 months. Period.

Are you sure? I got the same story from Dr. Kelso yet later I found
KEPS for the moon included in some software for the HP95/HP200
palmtops. Most recently, my LOGSAT program came with the moon KEPS.
Seems to work fine.

Larry, I'm a beginner myself so I won't be much help. I think you are talking about mode A (2 meters up - 10 meters down) I only know of 2 satellites on mode A. RS 12/13 and RS 15. I cannot work RS 15 because my antennas are inadequate and the signal is weak. RS 10/11, while still listed by AMSAT has not been heard since early May. I believe there is an RS 16 in orbit but it has failed to respond to commands and is inoperative. Winorbit which you can download from www.sat-net.com is an orbital prediction program and in addition has a lot of info on different satellites. It is freeware. Bill, W2BY

1521. Equipment List with Pictures and TAPR TrakBox

Newsgroup: rec.radio.amateur.space
Date: 1998-07-10 00:00:00 UTC
From: Bill <bill@halcyon.com>
Message-ID: <01bdaba4$d7ef1c80$93203fce@bill.halcyon.com>
Source record: 15802

I am selling some of the items I am no longer using. Each item on the list below has a hot link to a picture or pictures of the item.

My terms of sale are as follows:
I will not ship outside the US.
Payment should be by cashiers check or money order.
Buyer pays shipping and insurance.

You can view my high integrity rating on eBay. My name there is "bill".

You may contact me by email at bill@halcyon.com

Here are the items!

Kenwood TS-450S

This is an all band HF rig. It is in good shape with just a few minor scratches on the case. There are no accessories or a manual.

If you have been looking for an inexpensive HF rig with all the bells-and-whistles this is the rig for you. I am not sure if this rig has a tuner installed.

Because of its small size and handle this rig would make a perfect DX-pedition transceiver!

A picture is available at:

http://www.halcyon.com/pub/users/bill/TS-450S.jpg

The sale price is $600.00.

MM-3 Keyer

This is one of the famous keyers from AEA. These are now collector's items. AEA has not sold them for about 3 years now. There won't be any more of these!

The keyer has more features than any I have ever used, memory, contest mode, contest simulator, serial number, paddle reverse, and much more. I have included a picture of the label on the front of the keyer that has a list of all of the functions. The keyer comes with a manual.

The link to the function label is below:

http://www.halcyon.com/pub/users/bill/mm3-lab.jpg

The front of the keyer can be viewed at:

http://www.halcyon.com/pub/users/bill/mm3-fnt.jpg

The rear of the keyer can be viewed at:

http://www.halcyon.com/pub/users/bill/mm3-rear.jpg

Sale price is $150.00

TAPR TrakBox Kit

Automatically point your satellite antennas.

This kit was sold several years ago by TAPR. It contains the PCB, IC, Display, instructions,resistors and capacitors. It is in the exact condition as shipped from TAPR.

Sale price is $60.00

>I have Nova and the keppler element for the moon seems accurate.

(snip)

Yeah... you can get a set of Keps that will give you reasonable right ascension and declination for the moon, though the radius will be off. Come to think of it, many years ago I generated Keps for the Sun which also provided accurate r.a./dcl., with a radius that was nowhere near reality. Ol' Ptolmey wasn't all THAT far off!

In either case, if the radius is big enough, it won't affect terrestrial look angles very much.

1524. Best equipment ??

Newsgroup: rec.radio.amateur.space
Date: 1998-07-10 00:00:00 UTC
From: Robert Bates <robbates@gold.net.au>
Message-ID: <35A6003F.B6F502B9@gold.net.au>
Source record: 15805

I'm just about to renew my licence after many years and of course get some equipment together. My question relates to the best way to enter SAT comms. The Yeasu 847 looks very tempting but would I be better off with mono band trx's for 2m & 70 cm.
I would also like to make some kind of antenna tracking device. My current line of thought is to use rotary encoders but these are very expensive
Possibly the innards of a computer mouse and limit switches for initialisation and orientation could be used. One problem I see here are hardware conflicts by having 2 mice on one computer and the lack of spare com ports on my machine
so any further ideas on this topic ?

Thanks

Rob

1525. Feeding OSCAR with 9913?

Newsgroup: rec.radio.amateur.space
Date: 1998-07-10 00:00:00 UTC
From: mg <seven77@gate.net>
Message-ID: <35A60ED3.814@gate.net>
Source record: 15806

Good morning!

I am setting up an OSCAR station, and have a run of 9913 I would like to run directly to a beam controlled by an el/az rotor. I have heard that if one cripples the 9913 with a rubber hose, or lengths of RG58 to take the strain of the flexing and keep the 9913 from kinking, it will work.

I know that there won't be much signal loss in a well prepared 9913 to 213 coupling, but the lumped impedance mismatch of 2 more connectors and the possibility of increased SWR on a mode I hope to make some weak signal contacts bothers me. I can control the impedance of a single run of 9913 to well made N connections.

Do any of you have any techniques for doing what I hope to accomplish?

Thanks in advance!

My department is considering purchasing a Rapid bank charger for the Motorola MTX8000 radio. I have been asked to look into it. I request bids for the above charger, I prefer to get new, but I will look at all bids, but the charger must work perfectly, and be in New condition. I request you send bids to me at my e-mail account, If I need then on letter head, I'll e-mail you back.

Also, Out Police Auxiliary may be getting several more MTX8000 B5 models, and have normally gotten them from the local moto shop, if you have some, send a bid to me here at this e-mail, and I'll pass it along,

Thanks in advance

Dave

Dan's right (people whose email addresses end in gsfc.nasa.gov
often are): the satellite orbit models all assume a satellite
in orbit around the Earth, whose mass is negligible compared to
the Earth, with perturbations generated by the Sun and the Moon.
_Spacetrack Report No. 3: Models for Propagation of NORAD Element
Sets_ gives the equations and is available on the net.

The Moon breaks these assumptions, so the models don't work.
To predict the Moon's position with any accuracy you must model
Earth and the Moon jointly orbiting the Sun.

A common dodge is to derive short-term Keplerian elements from
the equations of the Moon's motion - there are programs on
the net that do this. These elements will predict the Moon's
position for a while, but the predictions will degrade with
time, since they do not model what is actually happening.

This is reality, folks. It is not subject to debate.

>both a Yaesu az/el rotator and compensate for doppler on an FT847.

IMO it is a waste to have a microprocessor-controlled tracker which is
loaded with 2line keps from a PC. A PC can control the antennas by itself,
and even with M$ software it should be possible to run such a task in the
background.

I have used a Linux system for this purpose for some time, and it worked
very well. I used an AMSAT-DL tracking interface (homebrew, also available
commercially as a small addon box for the Yaesu rotator).
It can be interfaced to a serial or parallel port, it just needs two
general-purpose outputs (RS232 control lines or printer lines) to get its
info.

When deciding upon an interface, watch out for this: the control-loop
driving the antenna position (ist-wert) to the desired position (soll-wert)
should be in hardware, and preferably be protected by some watchdog.
Don't get an interface which works by driving the rotators in software,
repeatedly reading back the current position and stopping the rotators
when it is reached. When the PC crashes it will drive the rotators into
the endstops, and these are not protected on the G-5400!
I have read reports of burnt-out motors which happened this way.
A KC tracker is an example of such a bad design.

9913 survives an az/el rotor just fine if you leave enough of a
free section at the rotor. I've used 9913 for my az(only) for many
years without trouble.

Also, if you really want a section of 213 for some reason, the loss
due to impedence discontinuity is measureable, but quite small.
You'll never hear it on a 2m OSCAR downlink. You'll probably never
hear it on 2m EME either!

1533. Redhat support for ham software

Newsgroup: rec.radio.amateur.space
Date: 1998-07-12 00:00:00 UTC
From: arm@helix.nih.gov
Message-ID: <6oavei$mpq1@icet.net.nih.gov>
Source record: 15814
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.space,rec.radio.amateur.dx,rec.radio.amateur.antenna

Redhat, the largest distributor of Linux (free unix for the PC), has hired an active ham to move ham radio software into the mainstream of the Linux platform. Jeff Johnson, N3NPQ, has asked the ham radio community to identify and test ham software for Linux. If you have email, you can help decide what ham-oriented software will become available on the Redhat distribution.

Jeff is compiling a list of the software that hams want included. This can be public domain or commercial softare. This can include software that already runs on Linux, or software that would need to be ported to Linux.

Jeff is also compiling a list of people who are running Linux and are willing to test some of the ham software. Please let him know what packages you would like to test.

Here is how to contribute:

Send an email to:
jbj@redhat.com

Begin the subject line with Jeff's call:
N3NPQ - <meaningful subject here>

Please don't do a "reply" to this email. The reply will come to me, which won't do any of us much good.

Note, if you want to see an example if what Linux can do, check out the Internet Web Radio Receiver in last February's QST, or try it on line at:
nihac.info.nih.gov/listener/listener.html

Just sent myself a test message via amsat.org and it worked fine.

Seriously - by the time AMSAT finds P3D a ride the frequencies it operates
on may be already sold to commercial interests.

Maybe it's time to sell the thing to someone that can actually launch it.

Probably a better idea would be to take the thing appart and sell it at the
local hamfest. I'll bid on the local oscillators.

1538. RS-15 not working?

Newsgroup: rec.radio.amateur.space
Date: 1998-07-13 00:00:00 UTC
From: Erik Skovgaard <Erik_Skovgaard@bc.sympatico.ca>
Message-ID: <6oeou7$ml5$1@news.bctel.net>
Source record: 15819

I noticed both last night and this evening's pass around 21:45 (local time) that the beacon was a carrier on for a few seconds and off for 2-3 seconds.

I could not hear my own signal on the downlink - even when I cranked the power up to 120 Watts. I did not hear any other signals on the bird.

Can anyone enlighten me?

73 de VE7MDL ....Erik.

1539. Please help with Pentax ME Super and Bushnell reflector

Newsgroup: rec.radio.amateur.space
Date: 1998-07-14 00:00:00 UTC
From: mike5923@aol.com
Message-ID: <1998071403032600.XAA25289@ladder01.news.aol.com>
Source record: 15820

I have a little question for you all, I hope you can help. I purchased a Meade Camera attachment to use on my Pentax ME Super with my Bushnell reflector. You can't use an eyepiece with this setup because the camera serves as the eyepiece. But to focus on an object (the moon, for example) I can't turn the focusing knob down enough to see the moon properly. I can turn it and turn it, and the moon gets clearer and clearer but never gets focused- it just wont turn anymmore. What do you think I should do? Thanks for any suggestions.

Please email me, I get lost in these newsgroups :)
Thanks again,
Mike

Indeed. According to AMSAT and to Popular Science, as well as NASA, amateur radio has been slated as an "official payload" aboard the ISS. Should provide fun for years to come.

The amateur station is supposed to be one of the first payloads from what
I've heard.

You can download G3RUH's PLAN13 program from AMSAT's web site
(http://www.amsat.org). It's in BASIC, though...

The equations you need (with FORTRAN source code :-) are available
on Dr. Kelso's web site. Why not write your own program?

1552. What do you think of Kenwood TS-177/TS-811?

Newsgroup: rec.radio.amateur.space
Date: 1998-07-15 00:00:00 UTC
From: Larry Brandt <lrbrandt@statestreet.com>
Message-ID: <35AD21E2.2ADE228A@statestreet.com>

Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.equipment,rec.radio.swap

Hi,

I currently own a TS-700SP, 2M allmode rig from Kenwood.

I received it recently from an internet post and the thing works great!
Great audio, GREAT noise blanker (used in my car a few times),
SSB/AM/CW receive/XMT seems fine, etc.

I'm interested in picking up a similar unit for 440mHz. Kenwood says
the only similar 70cm unit is the TS-811. I've seen some talk about
computer control of the TS-711/TS-811s and might want to go this route
as I'd like to use these rigs for satelite as well as general weak
signal all mode work.

But some satelite folks say the 711/811s don't work well for satelites.

Any ideas why? Which do you/have you had? Did you like them?
If you didn't like them or they were not suiteable for your application
what was the problem? Was the radio OK but the computer control sucked?
Or vice-versa?

Do you have the any for sale? Have youused it for sats, eme, or what?

73,

Larry

Now that is news to me, that it is supposed to be early in the
process rather than later. I know I read it is not in the first
payload (wether that is right of course is another matter

1556. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.space
Date: 1998-07-16 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6ollmp$kjm@news.Hawaii.Edu>
Source record: 15689
Cross-posted to: rec.radio.amateur.space,rec.answers,news.answers

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

: >the moon?
:
: It wouldn't work that way. All of the satellite tracking programs
: assume that the mass of the satellite is negligible compared to the
: mass of the Earth. That's OK for man-made satellites, but not for the
: moon. The mass of the moon is about 1/80 the mass of the Earth, and
: the moon's gravity exerts a noticeable pull on the Earth.

Well, the center of gravity for the Earth-Moon system is a few
thousand kilometers off the center of the Earth, but still well below
the surface of the Earth. Since both bodies are orbiting this center
of gravity, there will be a few thousand kilometer error in the
position, if the program assumes that the other body orbits the center
of the Earth (as most satellite programs do). Even if the program
correctly calculates the positions relative to the center of gravity,
the lunar orbital elements are constantly changing, mainly due to
solar pull and tidal losses. Thus, any simple 2-line orbital elements
will be valid for only a few days or a few weeks (depending on
accuracy needed).

Unfortunately, we have done, and done, and done for these guys. They know they have a patsy on their hands and can do anything they want with us. It is time to send them the bill for $10M for developing and constructing the SBS, which they have already used one of. If they decline to pay the bill, we should offer to let them launch us on the 503 instead, or take it to the World Court, and make a very nasty public relations nightmare for Arianespace. The time for delicate negotiation is over guys, unless you all want to wait till Yuma Arizona freezes over for a launch.

An excellent suggestion! It's not difficult. Simply use the appropriate
Keplerian elements (epoch, mean anomaly, mean motion, semimajor axis,
period - take your pick) to solve Keplers equation for true anomaly and
radius, convert the polar coordinates to cartesian and then do the linear
transformation into inertial space. Then figure out what the
first point of Aries is for the time you're interested in, rotate the coordinate
system from inertial to earth rotating, then the dot product of the radius
vector to the satellite and the radius vector to the ground station will
give you the sin of the elevation. If the sign of the sin is positive, the
satellite is visible, if not, not. Pick a different time and repeat the process
until the sin is zero. That time will be either rise or set - your previous
calculations should tell you which if it isn't already obvious.

Simple, right? ;->

The Amsat-bb list recently (July 4th weekend) went to an automated
list server. One consequence of this change is that you need to be
subscribed to the list before you can post to it. If you send your
e-mail from a different address from the one that you use to subscribe
to the list, it will not get in. To get a help file with instructions
send a blank message to majordomo@amsat.org.

Yes. About 10 minutes from downtown. A local tv station bought the tower and wanted everything off of it. The owners lowered it to the ground and to me, "Merry Christmas".

I mean if you need a dish this is the one!

Have you ever wanted to make a contact with a famous ham, but that ham was a silent key? (You know, dead?) Well, your worries are over! Madame Gozonga, a world famous medium, (some say she's an extra large, but that's beside the point) will be operating special event station W1AW while in touch with the departed spirit of Hiram Percy Maxim, on Labor Day, September 7, 1998, 0000-2400z. Madame Gozonga's credentials are well know to movie stars and other celebrities, as well as federal, state, and local law enforcement offcials. She was carefully selected at random from the many phychics who advertise in the classifieds of Weekly World News, and other fine publications.
The ARRL has designed a special certificate to commemorate this historic event. The logo on the certificate will be a silent key. Operating frequencies will be 25 khz up from the bottom portion of the general phone and cw segments of each band, simultaneously.

To make contact, tune into the frequency and repeat the following phrase, followed by your callsign.

Oh-wah,
Tah-nah,
Sy-am.

Keep repeating the phrase, followed by your callsign, until you are acknowledged. You will then receive a lovely 8 1/2" x 11" certificate, suitable for framing, or kindling, or whatever else you want to do with it. Please to not send any QSLs to W1AW. Your callsign will be acknowledged and noted on the log, and you will get yours. Please allow 10 to 15 years for delivery.

Unfortunately, we have done, and done, and done for these guys. They
know they have a patsy on their hands and can do anything they want with
us. It is time to send them the bill for $10M for developing and
constructing the SBS, which they have already used one of. If they
decline to pay the bill, we should offer to let them launch us on the
503 instead, or take it to the World Court, and make a very nasty public
relations nightmare for Arianespace. The time for delicate negotiation

is over guys, unless you all want to wait till Yuma Arizona freezes over
for a launch.

From: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Subject: Guide to the rec.radio Newsgroups

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet

mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and

video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham
radio gear, and other folks besides hams swap ham equipment. If you have radio
equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about
the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and
selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be

directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations.
The .equipment group is not the place for buying or selling equipment; that's
what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle
Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s
with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This
gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists
==========

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine
interest in both groups in the topic being discussed, and when you do, please
include a header line of the form "Followup-To: group.name" in your article's
headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers

of this article.

One of the few examples of productive cross-posting is with the
rec.radio.info
newsgroup. To provide a filtered presentation of information articles, while
still maintaining visibility in their home newsgroups, the moderator
strongly
encourages cross-posting. All information articles should be submitted to
the
rec.radio.info moderator so that he may simultaneously cross-post your
information to the appropriate newsgroups. Most newsreaders will only
present
the article once, and network bandwidth is conserved since only one article
is
propagated. If you make regular informational postings, and have made
arrangements with the moderator to post directly to the group, please
cross-post as appropriate.

>both a Yaesu az/el rotator and compensate for doppler on an FT847.

IMO it is a waste to have a microprocessor-controlled tracker which is
loaded with 2line keps from a PC. A PC can control the antennas by itself,
and even with M$ software it should be possible to run such a task in the
background.

I have used a Linux system for this purpose for some time, and it worked
very well. I used an AMSAT-DL tracking interface (homebrew, also available
commercially as a small addon box for the Yaesu rotator).
It can be interfaced to a serial or parallel port, it just needs two
general-purpose outputs (RS232 control lines or printer lines) to get its
info.

When deciding upon an interface, watch out for this: the control-loop
driving the antenna position (ist-wert) to the desired position (soll-wert)
should be in hardware, and preferably be protected by some watchdog.
Don't get an interface which works by driving the rotators in software,
repeatedly reading back the current position and stopping the rotators
when it is reached. When the PC crashes it will drive the rotators into
the endstops, and these are not protected on the G-5400!
I have read reports of burnt-out motors which happened this way.
A KC tracker is an example of such a bad design.

From: Larry Brandt <lrbrandt@statestreet.com>
Subject: What do you think of Kenwood TS-177/TS-811?

Hi,

I currently own a TS-700SP, 2M allmode rig from Kenwood.

I received it recently from an internet post and the thing works great!
Great audio, GREAT noise blanker (used in my car a few times),
SSB/AM/CW receive/XMT seems fine, etc.

I'm interested in picking up a similar unit for 440mHz. Kenwood says
the only similar 70cm unit is the TS-811. I've seen some talk about
computer control of the TS-711/TS-811s and might want to go this route
as I'd like to use these rigs for satelite as well as general weak
signal all mode work.

But some satelite folks say the 711/811s don't work well for satelites.

Any ideas why? Which do you/have you had? Did you like them?
If you didn't like them or they were not suiteable for your application
what was the problem? Was the radio OK but the computer control sucked?
Or vice-versa?

Do you have the any for sale? Have youused it for sats, eme, or what?

73,

Larry

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* OSCAR-11 NEWS *
=================
UoSAT-OSCAR-11 experienced a potential problem at the end of June after
a long period of uneventful operation. The telemetry status blocks showed
that the magnetorquer firing counters had stopped incrementing, and the
spin period was steadily increasing, implying that the satellite rotation
was slowing down. Normally the Z counter increments at about ten counts
per day, and the minus spin counter about five counts per day. These
firings maintain the spin period at around 360 seconds (one revolution
every six minutes), and keep the satellite pointing towards the earth.
The Z-axis counter got stuck at 1024 and the minus spin counter got
stuck at 486. After six days, the spin period rose to 640 seconds.

Ground control reset the counters on 1998-Jul-01, and started a new
WOD of the magnetometer channels. After three days, the spin period
returned to its nominal value. Under normal operation, the magnetorquer
control system stops working when a counter reaches 1024. This is a
feature to protect the satellite from malfunctions of the magnetorquer
control system.

During the period 1998-Jun-15 to 1998-Jul-14, reasonable signals were
received from the 145.826 MHz beacon. Telemetry is nominal, although
the battery voltage has tended to be rather low, averaging 13.5 volts,
with 13.4 volts observed on several occasions.

The internal temperatures have remained constant and are now 1.8C
and 0.4C for battery and telemetry electronics respectively.

The WOD survey of channels 1, 2, 3, 61 (magnetometers) dated 1998-Mar-19
has been been replaced by a survey of the same channels dated 1998-Jul-01
starting at 16:24:09 UTC. This was probably started at the same time as
the counters were reset, and shows the unusually high spin period of 640

seconds.

Reports of the OSCAR-11 Mode-S beacon have been received from Ed K9EK, Rick VE7SME, and Mike WL7BQM. Rick's report was of particular interest as he was using OSCAR-11 as a signal source while doing some RFI tests at the Australian National Telescope Facility.

UoSAT-OSCAR-11's operating schedule remains unchanged:

ASCII status (210 seconds)
ASCII bulletin (60 seconds)
BINARY SEU (30 seconds)
ASCII TLM (90 seconds)
ASCII WOD (120 seconds)
ASCII bulletin (60 seconds)
BINARY ENG (30 seconds)

The ASCII bulletin is currently a static message, detailing modes and frequencies of all the amateur radio satellites.

There are additional status blocks transmitted after each bulletin and between ASCII TLM and WOD.

The Mode-S beacon is ON transmitting an unmodulated carrier, but telemetry indicates that it has partially failed and delivering half power. This beacon is a useful test source for those testing Mode-S converters prior to the launch of P3-D. It is considerably weaker than DOVE, which should be used for initial testing (after it returns to the air). Any reports of 2401 MHz S-band beacon reception would be most welcome, and should be directed to Clive Wallis, g3cwv@amsat.org.

The 435.025 MHz beacon is normally OFF. However, it can sometimes be heard when the satellite is being commanded by ground control (within range of Guildford, UK). When the 435 MHz beacon is transmitting, the 145 MHz VHF beacon is normally OFF. The data transmitted is mainly binary.

Listeners to OSCAR-11 may be interested in a web site written by Clive Wallis. The site contains details of hardware required and some software for capturing data, and decoding ASCII telemetry and WOD. There is an archive of raw data (mainly WOD) that's available for analysis, and is continually being expanded as new data is captured. Also included are some audio files containing examples of each type of data transmitted by OSCAR-11. Each one plays for about ten seconds. There are also examples of Mode-S reception. All the audio files are zipped so that they can be played off-line. These should help listeners identify the various types of data transmitted by OSCAR-11, and give an indication of the signal quality required for successful decoding.

The URL is: http://www.users.zetnet.co.uk/clivew/

[Info via Clive Wallis, G3CWV]

* 70-CM COMMERCIAL INTERFERENCE *
==========

Reports from Guatemala indicate that commercial land mobile stations are currently being licensed in the 430 to 440 MHz band against International Radio Regulations. These stations may cause harmful interference to stations in the amateur-satellite service operating between 435 and 438 MHz.

Any amateur station experiencing interference from what appears to be a Guatemalan land mobile station should gather as much information as possible about the intruder including; call sign, frequency, emission type, and if possible, the content of its transmission(s). Also, note the date, time, and call signs of the other amateur station(s) with which you are attempting to communicate.

Amateurs should report all of this information to your national IARU member society so that a formal complaint may be lodged through appropriate diplomatic channels.

[Info via Art Feller, W4ART via the AMSAT News Service]

* TMSAT NEWS *
==========
Chris Jackson reported last week that the initial part of the flight software is now running on TMSAT, and the OBC has been switched to the downlink. Users familiar with the digital satellites will now be able to observe the satellite data using the standard groundstation software.

The satellite callsign is TMSAT1, and it is transmitting on 436.923 MHz. Presently it may be 3 kHz high in frequency due to the internal spacecraft temperature being quite cold.

* AMSAT-UK COLLOQUIUM NEWS *
==========
Richard W. L. Limebear, G3RWL reports that several changes have been made to this year's AMSAT-UK Colloquium. Some other "fine tuning" may occur, and will be reflected on AMSAT-UK's Web page <http://www.uk.amsat.org>.

The major change is that NASA astronaut Don Thomas will not be making the Colloquium, but Ron Parise, WA4SIR has kindly agreed to fill the "space". He'll be attending the International Space Station meeting as well as the Colloquium.

There are still a few delegate vacancies should anyone suddenly decide they want to come to AMSAT-UK's best Colloquium yet (only 2 weeks to go).

[Info via Richard W L Limebear, G3RWL]

rec.radio.amateur.dx,
rec.radio.amateur.antenna

Redhat, the largest distributor of Linux (free unix for the PC), has hired an active ham to move ham radio software into the mainstream of the Linux platform. Jeff Johnson, N3NPQ, has asked the ham radio community to identify and test ham software for Linux. If you have email, you can help decide what ham-oriented software will become available on the Redhat distribution.

Jeff is compiling a list of the software that hams want included. This can be public domain or commercial softare. This can include software that already runs on Linux, or software that would need to be ported to Linux.

Jeff is also compiling a list of people who are running Linux and are willing to test some of the ham software. Please let him know what packages you would like to test.

Here is how to contribute:

Send an email to:
jbj@redhat.com

Begin the subject line with Jeff's call:
N3NPQ - <meaningful subject here>

Please don't do a "reply" to this email. The reply will come to me, which won't do any of us much good.

Note, if you want to see an example if what Linux can do, check out the Internet Web Radio Receiver in last February's QST, or try it on line at:
nihac.info.nih.gov/listener/listener.html

I don't think anyone, except a few Russians who aren't talking, knows exactly what happened to RS10. some speculated that it was turned off along with the Cosmos host, when it was no longer useful. Other Russian sources have said that it failed and could not be resurrected.

In any event, it was a terrible loss to the amateur space program. It was probably the best of the "easysats" to use. It is sorely missed.

This is real. Just went to arrl web page. All Novices and Tech + to become Generals in essence if this goes through.

ARRL Proposes Simplified Amateur License Structure

The ARRL Board has agreed to propose a simplified Amateur Radio licensing structure with four classes. Lengthy discussion and debate during the Board's meeting July 16-18 led to majority support for a plan for four written examination elements to establish amateurs' operational and technical qualifications instead of the present five, and two Morse code examination elements instead of the present three.

Under the plan adopted by the Board, the entry level to Amateur Radio would be known as Class D and would convey the privileges of the present Technician license. The written examination would be at the same level of difficulty as that of the present Technician examination, but consistent with the privileges of the license. All amateurs now licensed as Technicians would become Class D.

The next step would be known as Class C and would convey the privileges of the present General license, but with phone subbands expanded by 50 kHz on 75 and 15 meters and by 25 kHz on 40 meters. Class C would be the entry level to high frequency (HF) operating privileges. To upgrade from Class D to Class C, an amateur would pass a written examination on the operational and technical qualifications required for HF operation and a 5 word per minute Morse code examination. All amateurs now licensed as General, Technician Plus, and Novice would become Class C. The expansion of the telephony sub-bands would result from "refarming" of the Novice CW bands that are no longer required for their original purpose.

The third step would be known as Class B and would convey the privileges of the present Advanced license, but with phone subands expanded by 50 kHz on 75 and 15 meters and by 25 kHz on 40 meters. To upgrade from Class C to Class B, an amateur would pass a more advanced written examination similar in difficulty to the present Element 4A and a 12 word per minute Morse code examination. All amateurs now licensed as Advanced would become Class B.

The final step would be known as Class A and would convey the full privileges of the present Amateur Extra Class, with telephony sub-bands expanded by 50 kHz on 75 and 15 meters and by 25 kHz on 40 meters. To upgrade from Class B to Class A, an amateur would be required to pass the most difficult written examination in the sequence. Consistent with the practice in many other countries, no additional Morse code examination would be required beyond 12 words per minute. All amateurs presently licensed as Amateur Extra Class would become Class A.

In their discussions, Board members emphasized that the objective is to rationalize and simplify the amateur licensing structure without reducing the requirements for any class of license. Where reductions in Morse code requirements are proposed, there would be a corresponding increase in written examination standards. On the other hand, Board members were adamant that simplifying the structure should not come at the expense of privileges already earned by amateurs. Therefore, present Novice and Technician Plus licensees, having earned entry-level HF operating privileges, would be granted the new entry-level HF license.

Adoption of the simplification plan marks the culmination of 30 months of work by the Board, during which time the input of literally thousands of ARRL members and other amateurs and prospective amateurs was considered. The Board debated a wide variety of options including both smaller and larger numbers of license classes, higher and lower qualification levels, and different privileges. Nine of the 15 Directors voted in favor of the plan, with six opposed.

Following the meeting ARRL President Rod
Stafford, W6ROD, observed, "The debate was at times contentious and the result was
not unanimous. Some Board members
preferred greater simplification; others were uncomfortable with some of the
changes being proposed. However, every Board
member, without exception, left the meeting knowing that each of his or her
colleagues did what they believe is best for the future
of Amateur Radio."

Members are urged to contact their ARRL directors to comment on this proposal.
E-mail addresses are on page 10 of any issue of
QST. Members also may comment on the proposal via the ARRLWeb site,
http://www.arrl.org or via e-mail at restrux@arrl.org.

Yep, its been in the works for awhile now. Sort of answers allot of questions. I believe the FCC wants even fewer license classes however. This maybe the ARRL's counter offer.

The only part I don't like is the NAMES for the license classes. We can NOT call Techs Class "D" hams ... that infers that they are substandard [just like a "D" grade in high school or college was a failing grade].

I prefer Technician, General, Advanced, and Extra class.

But I understand the FCC is working on its on rule making to have only 3 classes of hams ... and only one cw testing speed [5 wpm]. Looks like the ARRL found out and is trying to keep 12 wpm for Advanced [B] and Extra [A] class.

I don't find an issue with saying a person is a "class a,b,c,d"
license-holder. It doesn't indicate that the person is sub-standard, it only
describes the license class.

The U.K. has had "Class A" and "Class B" licenses for years... but then again,
they're not as far down the Political-Correctness-silliness road that we seem
to be.

Okay, I got a solution. Instead we use the following designations.

Class A = Big Cheese
Class B = Medium Cheese
Class C = Little Cheese
Class D = Velveeta

Oh no! I can see it coming, just like the high school sports
classifications - license classes AAAA, AAA, AA, and A.

Maybe we should make the "D" class the one with the most privileges.

Chris,

I'd like to see some hard nosed businessmen on the AMSAT board. Ones who wouldn't be reluctant to play hardball with any agency that want's to play that way with us. This nice guy routine isn't working! If we sicked some lawyers on those who haven't lived up to the contracts with AMSAT and sent some lobbyists to do the under the table pay offs to the correct government officials, maybe we could get some action. PH3D sitting there gathering dust is a *shame*! I'd like my money back and I know those that spent so much time and effort designing and building PH3D must be even more frustrated.

Your idea is like asking mom and pop to take on General Motors
and Microsoft. AMSAT isn't in the same league as the agencies
with which it has to deal. If it tried to give them a hard time, they'd
squash it like a bug, and we'd never get anything launched again.

You need to grasp some realities here. The launch agencies
have annual budgets in the *billions* of dollars. Their legal
departments have annual budgets greater than the total amount
of money AMSAT has raised over its entire existence. Any
attempt to coerce them is absurd. You're like the flea climbing
the elephant's leg with delusions of rape.

It is *essential* to maintain goodwill with these agencies. It
is the only way we can get launches at prices we can afford.
That means being willing to gracefully step aside when necessary
in order to let them deal with their primary business issues. We
fly very much on standby, and that means we're subject to being
bumped for any reason. That's the only way we can afford to
operate.

How do you know this? Recent activity on amsat-bb and the various
web pages suggests that they are being sensible about it. Accept
the situation, and then consider how to make the best use of the
extra development and testing time the launch delay has created.
It beats screaming like spoiled children. More productive, too.

Example: YAHU. "Ohne RISC, kein Spass" indeed. :-)

Someone should get the facts straight. The decisions concerning the payload to be flown (or not flown) on Ariane 503 are made by ESA, not Arianespace. This flight is to be a second qualification flight, after which the vehicle will enter commercial service under Arianespace's control. The choice of a payload to replace the damaged Eutelsat W1 was made by ESA, to minimize any further delays in the qualification schedule. The mission analyses required for such a complex mission are not trivial, and substitution of a completely different type of spacecraft would entail many months further delay -- clearly not an acceptable option after the delays already incurred. In any case, I believe ESA will make every attempt to find a reasonable solution to the problem.

I don't know the facts concerning the various assertions about unfilled promises, but I have first hand knowledge of the many micro- and mini-sats that have been launched as auxiliary payloads on several Ariane flights, at very low cost, for many educational and scientific users. There have also been AMSAT launches in the past, including AMSAT IIIC on V22 and ARSENE on V56.

As some of the commentators here have said, 'tis better to talk than sue.

1593. PACSATS: PSK modems and Doppler shift

Newsgroup: rec.radio.amateur.space
Date: 1998-07-22 00:00:00 UTC
From: Cedar Ryan <cedar@mweb.co.za>
Message-ID: <35b6417b.0@news1.mweb.co.za>
Source record: 15725

Hi All,
I am busy prepping my station (ICOM 821 etc) to work the Pacsats but I have two questions as follows:
Where can I fing 1200 baud fsk modems; have ther been any circuits etc published to make these. I know that Pacomm make one (PSK 1200 I think) However, the SA Rand / dollar exchange rate has moved against me. HOWEVER, if all else fails this would seem to be the route to follow. Any comments ?
Secondly, despite much reading about PSK, Manchester encoding etc and the need to compensate for doppler shift during a pass, I still have not discovered EXACTLY how to accomplish this. Is it as "simple" as connecting the rig's "up and down" microphone connections and then "voila" doppler shift is catered for ? What actually controls the rig to compensate for doppler ?
Any help, comments, reading lists etc would be appreciated.
Many thanks
Cedar Ryan ZS6JQ; Roodepoort, South Africa.

Hi Gary,
For perhaps the first time ever in reading newsgroups, I don't agree
with your take on this one. AMSAT had a legal agreement, which was

violated by one party. In court, this is Breach of Contract. AMSAT would certainly be within it's rights to go to court, either in France, or in the World Court, to ask that a $10M bill be paid by Arianespace for design, development, and construction of the SBS, one of which has already been used. They could either pay up the $10M, or provide us a launch in lieu of money. They know that kind of bad worldwide publicy for their company can't be allowed to happen. That is why they will want to settle with us on an agreeable solution before that happens.

We need to get tough and play hardball with Arianespace, and ESA. Otherwise, we never will get this bird launched.

I am looking for a mint condition TM455A 440MHz all mode radio.

I am also looking for different satellite type hardware such as:

9600 baud TNC (PSK or G3RUH?) to receive telemetry and work the LEO birds
2M & 440MHz satellite antennas (KLM, M2, Hygain, NOT Cushcraft)
Pre-amps/amps for 2M & 440MHz
Yeasu G5400B Rotator
Kansas City Tracker
Anything else I might need...

Thanks for reading & 73,
Tim

A FAQ I found reckoned that the easy sats could be picked up with the average shortwave receiver but now i read that RS-10 has disappeared (which explains why I can't get it). What kind of (cheap) setup do I need to receive signals from the birds (I'm not licensed for ham - yet)?

Simon

Source record: 15734

There are no silly questions.

I have a friend that works RS-12 with
a Grundig Yaugtboy 400 portable radio and he
uplinks with an old Icom all mode with 10 watts
out that he paid $250 for.
RS-10 has been off the air for about 2 years
now.
RS-15 is usable but I dought a portable radio
will hear it (very weak with deep QSB).
RS-12 Mode A is your best bet for a cheap and
dirty set-up. Very easy to hear and I understand
it is still in mode KA. Meaning that you can uplink
on 15M or 2M and downlink on 10M. On 15M I would
use a horizontal dipole and on 10M I suggest a
10M Turnstile that is easy to build. Use the turnstile
about 8 feet off the groung at the support. 73.

I agree! It's a lot better then saying one is class A or C. But then it
is upto the FCC to decide.

About the only part of the new proposed license system I find
disappointing is the fact that the Amateur Extra class is still around.
What perpose does it serve?? It seems that it's just there so people can
have their 2x2 calls.

Why not just make what is now the Advanced class the top license class?
Do we really need more then three classes?? I think three is more then
enough, as we would have a no-code basic license, a "middle" class with
HF, and of course the Advanced class with everything. Canada seems to be
doing well with their three class system.

And you may ask, what are we to do with the unissued extra class calls?
Well, we do what the Canadians do with their 2x2's. Issue them to
Amateurs who have been licensed for 20 years or more and want one.

Just some thoughts...

>It is *essential* to maintain goodwill with these agencies.
~~~~~~
Maybe not this one. It doesn't matter that we have only spent
a few million on the launch. It's still money and it was still
a contract. The goodwill seems one sided and possibly out of place
here unless ESA shows *some* cooperation.

Then why make such a statement in the first place? If asking
people to justify such sweeping statements labels me "hostile",
so be it.

I still feel that ESA/Arianespace are our best bet for a launch,
and do not feel that the lynch-mob mentality in this newsgroup is
justified.

Flames accomplish nothing. When I know what I'm talking about,
I will argue a point. If I don't, I shut up.

Hi Gang,

I have for sale a Yaesu FT-726R 2 meter & 432 all mode transceiver. It has the Satellite board installed, internal power supply, 10 memories, 2 VFO's, original manual, and hand mike. A 6 meter module could be added for tri-band coverage. This would be a great rig for someone that wanted to get started in weak signal or satellites. It works well and it is a 9 on a scale of 1-10 cosmetically. I'm asking $700 and I'll pay the shipping to your location in the continental US upon receipt of a US postal money order. References will be supplied on request. You can call me 515-243-5293 or email is OK. Thanks and 73,

Al

well VP Gore has this terrible idea to waste taxpayers money to have a
satellite with a camera always in daylight over the earth, Maybe we
could adapt P3D to do that job and offer it to Gore as the platform in
return for a "ride" to orbit? Being always in daylight would be good
for it [P3D] because it would always have solar power and it would be
in operation during daylight hours [good on weekends and during the
school week for schools]. Then Gore could have his PR satellite and
also be helping US hams.

There is one minor problem with this.

There is only one (more or less) stable orbit, I can think of, where the satellite is always above the daylight side, is around the Lagrange point between the Earth and the Sun (about 1 million km from the Earth). The SOHO solar observatory is (at least was prior to the communication failure) near this point.

To reach this point, quite a lot of fuel is required. From the user point of view, the path loss is about 30 dB larger compared to a geosynchronous or Molnya type orbit, so that much extra antenna gain is required at the satellite and/or user station. If the P3D antennas are not upgraded, the users would have to use parabolic reflectors that are 25-30 times larger in diameter than current requirements.

Yeah, and more or less, with the emphasis on less, stable is also true.
You'd need a lot more stationkeeping fuel than P3D can accomodate
to keep it in position.

As was once asked of the Pope, how many divisions can the World
Court field? In other words, the World Court has no real way to
enforce its decisions. There's little chance a French court would
be sympathetic either. But the worst scenario of all would be for
Arianespace to simply fork over the $10M, just as they have already
dropped $47 million of ESA funding just to accelerate their launch
schedule, and then tell AMSAT, "Go away, and never bother us again."
Then where would we be? We'd still have a satellite on the ground,
and no chance of getting it launched at any price we could afford.
(There's absolutely zero chance of buying a GTO launch for a
mere $10M from any other launch company.)

>We need to get tough and play hardball with Arianespace, and ESA.
>Otherwise, we never will get this bird launched.

It's their ballpark, their bat, and their ball. It's time to get real here.
We'll get launched on their terms, on their timetable, or we won't
get launched at all. Pissing them off will only make matters worse.
You've got to realize we're getting $70M worth of launch for a mere
$10M of *in kind* services. That's a hell of a deal, even if we have
to be patient for another year.

Ma Bell was broken up by Judge Green as the result of a decades long
Justice department anti-trust action. I suppose that if Arianespace were
under US jurisdiction, which it isn't, and if it were everyone's favorite
whipping boy monopoly, which it isn't, and if we were willing to wait decades
for the case to be settled, you'd have a point. We'd then have $10M, minus
legal fees of a few tens of millions, and there wouldn't be a launch company
in the world that would ever offer us a deeply discounted standby launch
ever again. So not only would we be in hock up to our ears to the lawyers,
but we'd be trying to scrap up the $70M for a full fare launch to GTO.
Some deal.

It lost it's first suit in a civil action regarding telephone
service monopoly to a small company in a lawsuit that didn't last but
a few months. The Patman anti-trust act federal suite followed.

As far as no agency ever dealing with AMSAT if AMSAT won a suit against
ESA, this is your opinion, not a fact. People and companies win suits
and continue to do business all the time. I bet even the lady that
won X million dollars from the fast food giant can still buy hot coffee
(although she probably shouldn't be handling it herself.) AMSAT isn't
just a charity.I don't think any agency is going to give us a launch just
because they like us or want to see us do well. I think they have
a more practical reason for any help given.

It actually was broken up by MCI. Judge Green was the Fed judge assigned to
the district where MCI filed. It all started earlier by the Carter Fone
decision.

Hello,
I've been interested in Amateur satellites. While I don't believe I have
the capabilities to operate, I'd like to monitor the downlink. Any information
would certainly be appreciated.
Sincerely,
Ed Hutton N3KEX

the government would pay for and provide the ride so it would not be
of concern to us.

From the user
>point of view, the path loss is about 30 dB larger compared to a
>geosynchronous or Molnya type orbit, so that much extra antenna gain
>is required at the satellite and/or user station. If the P3D antennas
>are not upgraded, the users would have to use parabolic reflectors
>that are 25-30 times larger in diameter than current requirements.

could the antennas be so upgraded??? if so I bet I could convince
AMSAT to do it. Our problem at this point is finding a White Knight
[sponser] to get us into orbit. $10 million to ride with ESA ... if it
cost us a little to improve the antennas to operate from the point you
mention then I think it would be money well spent.

seems to me there would be less heat ... certainly less friction from
orbiting so much farther away from Earth.

Only if we totally redesigned it, which we'd have to do anyway to
accomodate the much larger antennas it would require at that
distance.

Please remember that AMSAT = AMSAT-NA + AMSAT-UK + AMSAT-DL, etc All
who have been involved in P3D may not agree on anything like W4SCO
suggests. P3D will (when it gets in to orbit) be used by "hams" in
many countries not just the US. I do not like the idea of it being
used as some sort political "PR tool" to "brighten" their image
by anyone. All in all not a good idea???

could we save 90-95% of it for a "new" bird [P3Da]? If Gore is really looking for a bird maybe AMSAT should be thinking about making a proposal to be that bird? A design could be done on paper which would not mean stopping P3D as it stands now [in case ESA gives us a ride sometime after 2000].

The Carterphone decision dealt with interconnecting "foreign" equipment to the telephone network, in this case a telephone answering device. The Bell company wouldn't permit it, claiming only their equipment could be connected to their telephone network. Carter sued. As a result we have these little black globs in our modems with an FCC number stamped on them which are approved interconnect devices that allow us to legally connect our equipment to the telephone network. It had nothing to do with the breakup of the telephone company. But it had everything to do with customer owned equipment.

This is all moot. NASA has already done the Goresat design and has
pulled $34M from other programs to pay for it. Done deal.

:
: could the antennas be so upgraded??? if so I bet I could convince
: AMSAT to do it.

The VHF and UHF bands are usually served with one or more helixes,
finding room for tens or hundreds of helixes might be a problem :-)
and the power splitters might also be a problem. In the microwave
bands, horns are used. A horn antenna has a gain of 15-20 dB,
conveniently illuminating the whole hemisphere. The horn antenna gain
can not be extended much above 20 dB, so the only solution would be to
go to some parabolic reflectors. The only thing that would make sense
would be to use a huge extendable parabolic reflector (like in some
ATS satellites) and feed it with a multiband feed in the focal point.
However, this would require a complete redesign of the satellite.

Please note that this L1 Lagrange point is almost four times the
distance from the Earth than the Moon and the one way path loss is
over 200 dB even in the UHF range (but fortunately less than the
two-way EME path loss on se same frequency). The only positive thing
in using the Earth-Sun L1 Lagrange point I can think of, is that
tracking the satellite from the ground would be easy. On a cloudless
day aiming would be easy and a simple mechanical clockwork could be
used to turn the antennas following the Sun (and the satellite) and
manual tilting would be required only about once a week to compensate
for the seasonal changes.

I do not have the mass distribution of the SOHO satellite, which
"orbits" the L1 Lagrange point perpendicular the line between the
Earth and the Sun, but from the drawings I have seen, there does not
seem to be any huge fuel tanks for station keeping fuel, although the
SOHO planned life time was shorter than for any typical communication
satellite. So I guess the station keeping fuel would not be the worst
show stopper. "Orbiting" the L1 point (and thus not exactly on the
Sun-Earth line) in a "halo" orbit (as seen from the Earth) also
reduces the solar noise, which would otherwise disturb the downlink.

Yeah, but it would bake in the sun! No shade....ever... I am sure things like this can be designed for, slow rotation (rotisserie!), different reflective surfaces and what not. I am not sure P3D was designed for this type of duty.

Hi Gang,

I have for sale a Yaesu FT-726R 2 meter & 432 all mode transceiver. It has the Satellite board installed, internal power supply, 10 memories, 2 VFO's, original manual, and hand mike. A 6 meter module could be added for tri-band coverage. This would be a great rig for someone that wanted to get started in weak signal or satellites. It works well and it is a 9 on a scale of 1-10 cosmetically. I'm asking $700 and I'll pay the shipping to your location in the continental US upon receipt of a US postal money order. References will be supplied on request. You can call me 515-243-5293 or email is OK. Thanks and 73,

Al

1635. $300,000 prize offered for first amateur space rocket flight

Newsgroup: rec.radio.amateur.space
Date: 1998-07-29 00:00:00 UTC
From: David Anderman <davida@cwo.com>
Message-ID: <35BF2E87.668748EA@cwo.com>
Source record: 15667

The Space Frontier Foundation is offering a $300,000 prize for the first

'amateur' rocket to carry our 2 kg payload to 200 kilometers altitude (a

$50,000 portion of the prize will be given to the first launch to 120 kilometers).

No government surplus hardware can be used in the rocket's airframe or propulsion systems. The flight must be verifiable.

Dozens of teams from around the world are gearing up for the largest competition in the history of amateur rocketry (note that they could all use help with telemetry).

For more information on the prize rules, check out:

http://www.space-frontier.org/EVENTS/CATSPRIZE_1/

Getting off topic here, but still in thread, a little history
that supports Gary's comments:

1968 - - On June 26th a landmark decision in telecom history as the
Carterphone Decision is rendered by the FCC. Under this decision, the FCC
struck down existing interstate
telephone tariffs prohibiting attachment of connection to the public telephone
system of any equipment or device that was not supplied by the telephone
companies (Bell System). The
suit, which began October 28, 1966 centered on the desire of Carter
Electronics of Dallas to interconnect private mobile radio systems with the
nationwide exchange and message toll
telephone network. The Carterphone Decision created the interconnect industry
and allowed manufacturers other than Western Electric to sell their telephone
devices to business
nationwide. The telephone companies still managed a minor victory by
convincing the FCC that Bell System manufactured "interface devices" had to be
placed between any
non-telephone company equipment and the public telephone system. These
interface devices were struck down in 1978 when the FCC determined that any
equipment manufactured to
FCC regulations could connect to the public network via industry standard
network termination devices (RJ11C, RJ21X, etc.) In the mid-1980's the former
Bell System companies
were successfully sued for the fees paid by customers for these interface
devices (which were determined to be unnecessary) during the ten year period
from 1968 to 1978.

(I believe that as a result of these actions the Justice Department begin
to take notice Bell business practices and saw they were in violation
of the Patman Anti-Trust Act.This is just an opinion, not a proclamation.)

that does NOT make sense ... I have seen the pics of the earth from the moon. If we can see the whole earth from the moon then we do not need to be any farther out in space to do what Gore wants.

In fact I would think for a satellite to always show the USA in sunlight times would/could be much closer. We are only talking about showing the USA afterall, right? US tax dollars should be for US school children to see the USA ... not see South America or Asia or Europe. If we could put a satellite over the USA [P3D] it would be great for US hams.

if that got to be a problem and AMSAT-NA could get a ride on the
Goresat, then we could just buy out AMSAT-UK & AMSAT-DL for their
interest in the satellite, since their interest would be low without a
ride to orbit.

=========
SpaceNews
=========

MONDAY JULY 27, 1998

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* 76 GHz BAND CHANGE *
======================
Henry Ruh, KB9FO, reports that the FCC 3rd Report and Order amends Parts 2,
15, and 97 for use above 40 GHz. Current 76-77 GHz amateur band operation
is now suspended. It will be replaced by a 77.5-78 GHz band segment with
Amateur Radio as the primary service. Reason for the change was the use of
the band by collision avoidence radar systems which would pre-empt amateur
operation which is now secondary between 76-77 GHz.

* RS-12 NEWS *
==============
Tom Hart, AD1B, reports that a number of RS-12 regulars have made contact
with 8P9JJ recently via the satellite. A problem, however, exists concerning
the QSL route for 8P9JJ. It was first believed that John, K7DV was 8P9JJ's
QSl manager, but John reports that he's not connected to 8P9JJ in any way.
If anyone knows the correct QSl manager for 8P9JJ, please send the information
to any of the addresses listed below, and a follow-up report will be made in
a future issue of SpaceNews.

Thanks.

> We need to get tough and play hardball with Arianespace, and ESA.
> Otherwise, we never will get this bird launched.

A court case could get sticky. ESA could argue that the price
we paid included the inherent risks of a developmental program,
and that last minute design changes are just as much a risk as
launch vehicle explosions are.

Assuming we did sue, we might prevail in court, but we would NEVER
get another launch from ESA or Arianespace. I don't want P3D to
be Amsat's LAST satellite. Better to keep things civil. We are a
mouse and are not in a position to be pissing off elephants. ESA
will find a launch for us when they get around to it. We are not
their biggest problem right now. They have a $9 billion program
that is in a crisis, they need to get 503 launched and they simply
don't have time for us right now.

Let's keep things civil, and we will get launched someday. Piss
them off and maybe we will never get off the ground, with P3D
or anything else.

~~~~~~
I'm not sure if I'm forgeting or never new about it. The only other references
from that period that show up from a search during that time period are:

1974 - - The Department of Justice files an anti-trust suit against AT&T. "The
complaint...addresses the recurrence in the past three decades of anti
competitive activity...which dates
back almost to the foundation of AT&T". The DOJ wants a separation of "AT&T's
ownership of inter city facilities from its ownership of local facilities and
the separation of the
current providers of telecommunications services from the manufacturer of
telecommunications equipment and its allied research and development
facilities".

(Note the "anti competitive activity" statement. This shows up in Bell's
attempt to stifle Carterphone's
mobile phone hookup to the wire line which would be in direct competition with
Bell's mobile phone service.)

The Goresat will be paid for by US Taxpayers ... therefore the minimal objective would [should] be to see the USA, not South America [if it was harder to see both at once]. By concentrating on the northern hemisphere you would see the USA, Europe, Japan, etc. That is where most of the hams are and where most of the computer/internet users are [the ones who will be able to see the feeds over the internet].

1646. Satellite Times Article about Phase 3D

Newsgroup: rec.radio.amateur.space
Date: 1998-07-30 00:00:00 UTC
From: "G. Beat" <gregory.beat@mediaone.net>
Message-ID: <2U2w1.2$h43.122486@elnws01.ce.mediaone.net>
Source record: 15589

The August 1998 issue of Satellite Times has two articles on Phase 3D. One concerning the "Rocky Road" written by Philip Chien, KC4YER and a general article on Amateur Satellites by John Magliacane, KD2BD.

The ESA / AMSAT / Phase 3D story has received coverage in both industry print media, Internet newsgroups and the AMSAT BB. Organizations who specify, recommend or purchase launch services are watching Arienespace and ESA behavior in this matter. They are also awaiting closure of the matter and how it will be accomplished.

This type of matter should be quickly resolved by ESA and Arienespace. I am surprised that their marketing and public relations staff have been so quiet.

Here's my idea. And, that is we snivel up to the
government for the $15M to launch the thing.
Tell them that the satellite will be used for
educational purposes -- which I think is reasonable
since ham radio does have that component.
Show them how, say, P3D will be used to develop
new modems. Make up a nice neat package, talk to
a few politicians and try to sell them on the idea.
Has this been considered?

:
: that does NOT make sense ... I have seen the pics of the earth from
: the moon.

Have you seen pictures taking from the Moon during full moon ?
Which side of the Earth does it show, the daylight side or the night
side ?

: If we can see the whole earth from the moon then we do not
: need to be any farther out in space to do what Gore wants.

We would see the whole Earth only if the Earth is flat and the whole
population on the "top" side :-).

Nowadays, most people agree that the Earth is more or less a sphere
and you can see at most 50 % (when looking from an infinite distance)
of the surface at a given time. When moving closer, less can be seen
at once. From a satellite at geosynchronous orbit above the equator,
locations between 80N and 80S (on the same meridian as the satellite)
can be seen. On the equator, locations 80 degrees to the East and to
the West from the subsatellite point. If observing from an infinite
distance, locations +/- 90 degrees could be seen, i.e. the difference
is not much compared to the geosynchronous orbit. A lunar observation
post would see nearly +/- 90 degrees from the sublunar point.

The small increase in visibility area when going higher, is
compensated for most applications by the huge increase in path loss.

: In fact I would think for a satellite to always show the USA in
: sunlight times would/could be much closer.

The only place in the USA that I can think of that is in constant
sunlight (at least for some months) is the Northern part of Alaska
north of the Arctic Circle. But even at Point Barrow, the sun is going
to set at night within a week or two.

: We are only talking about
: showing the USA afterall, right?

If that is the idea, surprise, surprise, such cameras already exists.
They are located in geosynchronous meteosats, some of which are above
the US sending several pictures every hour. Too bad that the continent
below suffers periodically from lack of sunlight for about 30 times

each month.

I finally searched the net to find what Mr Gore actually proposed. I found http://web.mit.edu/newsoffice/tt/1998/mar18/gore.html which contains some interesting statements.

: The 330-pound, 175-watt small satellite ("Smallsat") to be developed
: and launched in two years would provide a view of the planet that
: would be available, via the Internet, to students, teachers, weather
: experts and the general public, Mr. Gore said.

Phase 3 D is a big fat bird (in both mass and power consumption) compared to this satellite, requiring a much larger and much more expensive booster.

: The satellite would orbit from a point where the gravitational pull
: of the Earth and the Sun cancel each other out, he said. The satellite's
: pictures would provide views of changing clouds, developing hurricanes,
: forest fires and other phenomena as they occur.

Sounds suspiciously like the L1 Lagrange point, which is about 1.5 million kilometers from the Earth (not 1 million kilometers as I wrote in a previous message).

1650. Space News Article about P3D and ESA

Newsgroup: rec.radio.amateur.space
Date: 1998-07-30 00:00:00 UTC
From: Dan Schultz <schultz@nospam.cddis.gsfc.nasa.gov>
Message-ID: <35C060EF.7C62@nospam.cddis.gsfc.nasa.gov>
Source record: 15678

The professional trade newspaper "SPACE NEWS" printed an article about Phase 3D and the Ariane 5 launch in their June 29 issue. Titled "ESA drops Amsat for dummy payload on Ariane 5," the article starts out by recounting what we alrady know, that P3D was originally scheduled to fly on 502, that it missed the launch deadline because of last minute changes required by ESA, and that Amsat was notified on June 16 that P3D would not be carried on the 503 launch. ESA believed that the commercial Eutelsat W2 satellite would be riding on 503, but a fire at a contractor's plant in France on May 18 destroyed a similiar W1 version of the satellite, causing Eutelsat to withdraw from launch negotiations. ESA and Arianespace have decided to launch a dummy satellite on 503 to simulate the W2 satellite.

The article continues:

>Soon after learning of Eutelsat's decision, Amsat officials
>thought the Phase 3D satellite would be selected for the launch.
>But in the letter to Meinzer, Fredrik Engstrom, ESA's director
>of launches, said it would take up to eight months to prepare
>Phase 3D for the flight -- too long to wait.
>
>Meinzer is incredulous. "Why should it take eight months to
>adapt our satellite to Ariane 5? This is a question I have. I
>also don't know why all these tests couldn't have been done
>earlier this year." Meinzer said Amsat told ESA that it might
>not find a commercial passenger and should prepare for a
>possible Phase 3D launch. "No one believed us and nothing was
>done," Meinzer said.
>
>Engstrom said in a June 24 interview ESA had declined to conduct

Can anybody send me by PM some info, who that W4SCO is?
He is very LOUD about P3D, but seems to know relatively few about how this bird was built (especially fitting in the payload support structure of a specific rocket, aka Ariane 5), the size and weight (and therefore cost if choosing a different carrier), the good relationship between AMSAT and ESA/Arienespace and the recent news about P3D (ESA/Arienespace payment of multi-million $$ to compensate for recent P3D modifications and storage costs).

Is he even a supporting member of AMSAT?
Is he a vivid user of current satellites?

Why can't he (and others) understand, that P3D was specifically built for Ariane 5? If he has the sources to easily "pay out AMSAT-UK and AMSAT-DL et al." as he wrote in annother posting, why not simply finance/build a new satellite made for a different rocket? I guess that would be cheaper than breaking P3D down to the parts and reuse some 40% to build the other satellite.

Cool off, people!

Stefan,
I don't think you realize the gravity of this whole situation. The
credability and perhaps future of AMSAT both NA and probably EU are both
on the line with P3D. Not to mention credibility with the whole amateur
community.

We all know that the sat was designed to launch on either the Ariane 4
or 5. Our only goal should be to force Arianespace to honor their

contract with us, or pay for development of the SBS, which was a contracted part of the cost for a launch, which they failed to provide during the development program of the Ariane 5.

Do you think that they will have any incentive to put our payload on a future operational, commercial Ariane 5 launch, when they can sell each of these slots for $15M and up? No, we needed to get launched on one of the development flights.

Also, as I understand it, we can be a secondary payload on the Ariane 5, but NOT on an Ariane 4 since too much delta V is required to get our sat to a 2500Km low orbit. How likely is it that they will launch us as a single payload on an Ariane 4 unless there is severe legal, and public pressure on them.

Let's wake up and smell the coffee. We (AMSAT) may be guilty of having champagne tastes on a beer budget, the we did have a contract, which they have broken. (Remember the part about doing their best to get us up by June 1997 on an Ariane 5, or making other arrangements) Let's get back to acting like shrewd yankee traders, instead of country bumpkins when dealing with these folks.

All satellites must be designed for their thermal environment, and
there are many that maintain a constant orientation to the sun.
Not only due to mission requirements (e.g. weather satellites in
sun-synchronous orbits), but also satellites with optics and things
that must never point at the sun (e.g. Hubble, MOST).

While the temperatures are extreme with one side of the satellite
perpetually hot and the other perpetually cold, the environment
is stable, and thermal design can take advantage of this.

P3D uses heat pipes to equalize temperatures. It's more important
to keep the antennas pointed at Earth and keep the solar panels
properly illuminated...

Good relationship? will I guess if you grew up in germany [lost two
world wars/ had to deal with the holocost/etc] I guess you might think
AMSAT has a "good relationship" with ESA. I think we are two years
behind schedule with no prospects for a launch anytime soon. Lets see
they promised us a launch in 1997/1998/?

what recent news ... news to me .. you say ESA is going to pay AMSAT
millions of $s to compensate for P3D modifications and storage costs?
WOW that would be great news. You are the first person to post this
news, what is your source?

>Is he even a supporting member of AMSAT?

YES I have already given almost $3,000 US to P3D [got my plaque at
Toronto to prove it].
>
>Why can't he (and others) understand, that P3D was specifically built for
>Ariane 5?

looks like a mistake the AMSAT hopefully will never make again. I have
always said that we should design our satellites so that they can ride
on several different launch vehicles. ALL we should be concerned with
are the electronics part of the repeater. Why can't we ride piggyback
on something like the Goresat and let NASA take care of getting us to
orbit and station keeping activities, etc? All we should be concerned
with is the operation of the repeater.

If he has the sources to easily "pay out AMSAT-UK and AMSAT-DL et
>al." as he wrote in annother posting, why not simply finance/build a new
>satellite made for a different rocket? I guess that would be cheaper than
>breaking P3D down to the parts and reuse some 40% to build the other

All I was saying is that without a ride all the satellite is worth is
what the parts could be sold for at a hamfest.

W4SCO

I am considering passing a petition around to the members and also
making the following motion at the AMSAT Conference in Mississippi
this fall:

"I move that we direct the counsel for AMSAT-NA to review within the
next 30 days, our launch contract with ESA for P3D, and if in his
opinion ESA has violated that contract then he is authorized to
immediately initiate legal action against ESA to either enforce our
contract and obtain a launch date within the next 365 days or to seek
punitive damages from ESA in the amount of 50 million dollars."

How do ESA personnel get to their launch site? Do they go through the
USA or overfly our airspace? If so possibly we could get our State
dept to deny access to any ESA personnel to the USA until this matter
is settled? Does ESA have any operations or property located with the
USA? Do they ship any of their supplies or products through any US
ports? There are always more ways to skin a cat than just the one
obvious way. We either have a launch contract with ESA or we do not.
Hopefully AMSAT did not sign one that allows ESA to change our "fee"
from a million or so to 10 million.

You are right about that ... it is very bad PR for them ... the way
they are dealing with us hams [who can not exactly afford very much,
in fact we are a charity organization.

If there was another [professional launch firm out there I would think
AMSAT would go with them in the future and never deal with ESA
again!!!! At least I will never give any money to AMSAT again for any
satellite riding on a ESA rocket. Other projects I am willing to
support, providing they deal with us in a FAIR manner.

So that is why they wanted all that CDH card hook up info we had in our
office. Never could understand why the Justice wanted any paper work from
our little independent Telecom company. Those where the days!

What is it that Gore wants? Does Gore even think before he wants
something?

Forgive me, but I have not been closely watching the US news for a while,
so I missed this one.

Do I get it right that he wants some satellite that provides pictures of
the earth as seen from space? And wants to launch that as some PR stunt or
to increase environmental awareness?

How on earth can a politician be so stupid as to announce this as a new
idea? Has he never heard of metereological satellites, or even military
satellites, that have been doing this for over 3 decades?

Or is this all just a joke?

Source record: 15598

Dear Friends:

Last weekend, on two consecutive passes, I attempted to link up to my
old friend, LU-19, and heard absolutely nothing on the downlink. Tonight, I downloaded a message from an Argentinian ham off of AO-16, which was written entirely in Spanish. I can understand some, and it seems to indicate that LU-19 is non-functional. It also seemed to say that the satellite is permanently off the air. It was a valued satellite to me and I am wondering if anyone has any further information, especially if I read the AO-16 message wrong.
Thanks for your help.

I don't think you understand the complexities of the space industry. You seem to think it would be simple to design a sat that could be screwed onto the top of any launch vehicle. Nothing could be further from the truth.

And there is one additional complexity that I don't think you have considered. The number of North AMerican hams who operate ham-sats is miniscule. The funds that could be raised from N. American hams wouldn't begin to cover the cost of a project like P3D.

P3D is an international effort and hams from around the world have contributed both sweat and finances tot he effort. I'm sure they would like to use the bird too!

NASA, being a US government agency probably isn't too keen on financing the launch of a bird for use internationally so you can rule that idea out.

Not only is it expensive to get a launch of any kind but it has to be the right kind of orbit so that the communications satellite can be shared with everyone, around the world. That rules out a "GoreSat" or virtually any other possible launch scenario that has been discussed in this forum.

It's an enormously complex issue and the answer clearly won't be as simple as the "why don't we just heave it out of the space shuttle" nonsense that is prevalent in this newsgroup.

It could very well be that P3D will never get off the ground. Such is the launch business.

But to believe that you'd have to overlook the resourcefulness of the folks that designed and built it and I wouldn't bet against them getting it launched just yet!

Hi Gang,

I have for sale a Yaesu FT-726R 2 meter & 432 all mode transceiver. It has the Satellite board installed, internal power supply, 10 memories, 2 VFO's, original manual, and hand mike. A 6 meter module could be added for tri-band coverage. This would be a great rig for someone that wanted to get started in weak signal or satellites. It works well and it is a 9 on a scale of 1-10 cosmetically. I'm asking $700 and I'll pay the shipping to your location in the continental US upon receipt of a US postal money order. References will be supplied on request. You can call me 515-243-5293 or email is OK. Thanks and 73,

Al

14,000 Radio Amateurs and their Phase 3D satellite can't be wrong. If you have a launch contract with Arianespace, look at it closely. Arianespace will look for any way they can to screw you up the ass! My advice: look for someone else to launch your payload.

Cross-posted to: rec.radio.amateur.space,rec.radio.broadcasting,rec.radio.cb

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Hi All,

Yaesu FT-726R, 430/2m module, satellite board, mic. *Excellent* condition.
$750. Manual and Technical Supplement (108 pages -- Service Manual).
Original box. You ship.

Please reply to Bob at:
bmyers@primenet.com

As someone who works in the satellite industry I can say that
Arianespace has not screwed my employer as bad as the Chinese or
Russians who launch our space vehicles. Have you ever seen what the
remains of a satellite that fell 20,000 feet into a rice paddy looks
like? I have and it isn't pretty. Back to the point, Yes I do
believe they bumped P3D in an 'undue manner' and that a similar
contract with an American company would have resulted in a launch on
(or at least near) schedule, and at a subtantially higher cost.

Tell that to those hubble space telescope guys who booked a space shuttle
flight...

I have for sale a-
AEA ST-1 Satellite Tracker box.
Connects to a parallel port.
Has a built in level converter for Icom,Kenwood and Yaesu serial radio
control.
Will plug directly into a Yaesu G-5400 alt. az. rotator control or
just about any other rotator that has 0-5 V. out for position.
I have been using it with the Nova Trak software.
$100.00 or trade for a 10 Meter rig in good shape.

So tell me exactly who is going to launch our next satellite after Phase 3D..... (And there WILL be other satellites after P3D). Do you know of some other launch authority that will give us cheap launches? Please speak up if you know of some alternative.....

There was an article about P3D in Space News in June, for which I have already posted excerpts to this group. ESA's director of launches was quoted in that article:

>Engstrom said the agency would do what it could to aid Amsat
>in finding space aboard an Ariane flight. "Arianespace's
>problem now is late satellites, and that means launching on
>occasion with extra space on the rocket," Engstrom said.

There was an article in the paper a couple days back about SEA &#65533;
LAUNCH.
A consortium is planning to launch geostationary platforms from a &#65533;
sea
going vessel near the equator south of Hawaii.

I wonder if the Oscar people have looked into launching with &#65533;
them.

(This is some time in the future, of course!)

I don't think NASA can redirect $34 million from other projects
without Congress having something to say about it. We can't even
put up a new building at Goddard unless Congress OK's it.

I looked at the NASA AOP last week, hoping that perhaps we could
propose the SCOPE camera on P3D (in a Molynia Orbit) as an
alternative to Goresat. The proposal seems to be inflexible
about having the spacecraft at the L1 point, and to make matters
worse, they intend to use the space shuttle with an upper stage
as the proposed launch vehicle. If the proposer wishes to use
an expendable vehicle they must obtain one outside of NASA at
their own expense.

I can think of lots of good reasons to park a spacecraft at
the L1 point between the Earth and Sun, but Earth observations
(as proposed by Gore) and communications relay (as proposed by
some people in this group) are not two of them.

Before I get flamed too badly, I should have
said: An international consortium is planning to
launch platforms into geostationary orbit using
Russian Energia boosters.
and...
I wonder if the AMSAT people have looked into launching
with them.

I am, of course, thinking some time into the future --
although the article did show a picture of the sea-going
launching complex.

frank@horizon.sri.com

who hopes that AMSAT, etc. will be alive and well in
the next century.

^^^^^^^
Now THAT would be spectacular! :) (Energiya is the vehicle
used to launch the Buran shuttle and one other payload back
in the '80s. It's apparently quite dead now.) The geosynchronous
vehicle Sea Launch plans to use is the Zenit-3, which is essentially
one of Energiya's four strap-on boosters with a couple of additional
stages.

Well, as they say, talk is cheap. We haven't seen much support from the Arianespace folks lately. For LEO launches, there are numbers of other possibilities. The new Techsats, ASUSAT, and others will NOT be going up on Ariane rockets. They'll be going up on Orbcom ground-launched, and air-launched rockets.

Bottom line with Arianespace, if they can't get this one up for us, what are the odds of them getting the next one up. One AMSAT BoD member I have been talking with indicates that he also believes that some VERY HEAVY backroom work, probably including the implied threat of bad publicity over the matter, will probably be necessary before the situation with Arianespace and ESA is resolved.

Just more evidence of the duplicity and malevolensce of Arianespace with AMSAT. Time to turn up the heat on them through worldwide negative publicity. I intend to make a motion at national AMSAT convention this year to issue a press release to all nations news services, indicating what was done as explained above. I'm sure most people will see their duplicity.

Tektites are not meteorites. They are material that is a result of a meteorite impacts. Tektites are also in good supply. they are interesting objects but are not meteorites.

If you need Alaska from one of the Western States, i've worked two stations on AO-27 Pacific passes in the past week, and heard KL0CY a couple of times since. We also had a Hawaii station on today (25 degrees elevation in S.F. Bay Area), but he was having trouble hearing the 'bird'. If you're trying to work the West Coast from the Islands, we're out here listening for you!

I've also heard reports the MIR repeater is back on-line. If anyone wants to try, i'll be try the late night passes (such as tonight at 0632Z). See

http://qsl.net/kd6pag/local.passes

for subsequent nights which, alas, has times listed in local time (PDT). I won't bother with the low elevation passes until there's been significant activity.

Indeed This likely one of the problems we face I agree that we
would prefer not to contract with them. We might have too. that is
another matter. But taking a harder line with Airenspace might have
it's merit after I can pay to seem to have some spine.

Thats true, but what has pissed off Amsat is the way they have been treated by Arianespace. The broken agreements, the mid-stream "price changes", and their failure to inform Amsat of critical changes in a timely manner. Most large companies needing launch services would raise a big stink if they were treated like Amsat was treated. Amsat has faith in Ariane rockets, but the business practices of Arianespace are fraud and they need to be investigated! That's why one needs to beware of Arianespace.

Amsat is essentially getting a free launch from Arianespace. Complaining
of changes is not very mature considering that Arianespace is letting them
go along just for charity.

>companies needing launch services would raise a big stink if they were treated

Those companies pay for their launch and are actual customers, unlike
Amsat.

Radio Meteor Observation Bulletin No. 60 August 1998

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Barcelona, Spain (01 59' E, 41 21' N)
Frequency: 48.250 MHz
Transmitter location: most likely Czech television C2 C. Budejovica,
100 kW, horizontal polarisation.
Antenna: 6-element Yagi 617-6B, 14 dBd gain.
astronomical azimuth 215 deg (=NE), elevation 0 deg.
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (100 Hz) and fed into the PC in real time.
Data sampling system: using a super 14 bits A/D card to PC/XT and
"Data Capture" software with 9 second/18 sampling interval to
store all the > 1.0 s signal increases.

Mike Boschat

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 20 deg
Antenna amplifier: 10 dB gain

Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

Will Kelsey

Observer: Werfried Kuneth
Location: Ferndorf, Austria (13 37' E, 46 45' N)
Antenna: 2 element Yagi, direction southeast, no elevation at 1m height.
Receiver: IC-706 at 53.76065 MHz, CW-R mode, 500 Hz CW filter, fast AGC.
Transmitters: 1) 30 kW TV video carrier from Bari, Italy, distance 700 km, direction south and 2) a 30 kW TV video carrier from Sicilia, Italy, distance 900 km, south. The total echo power of both transmitters is processed into same 40 Hz virtual receiver channel.
Observing method: automatic setup using FFTDSP42t software by AF9Y to record the audio signal. 20 channels of 2 Hz width are used for meteor identification, pictures with interference, sporadic-E, E-layer and FAI propagation are manually rejected. Sampling interval: one 4096 point FFT every 0.5 seconds.

The meteor counts below are corrected for a full hour observing time. If the recording duration is 20-40 minutes, a dot is shown after the value, to show the reduced accuracy. Results for less than 20 min. observing time are excluded.

Counts of reflections longer than 3.5 seconds:

| Jul 1998

Notes:
. no other correction except for "dead time" is used in the counts shown.
. Very good activity from July 24 to July 31, most likely from the
```

South Delta Aquarids. Maximum on July 28 and July 29.
. local time conversion: 2 hour ahead of UT (04h00 UTC is 06h00 local)
. July showed a very high number of thunderstorms and lightnings.

Werfried Kuneth

2. ANNOUNCEMENT

Another outburst?

The (meteorobs) mailing list (subscription instructions, see:
http://www.tiac.net/users/lewkaren/meteorobs/subscribe.html) carried a
visual observation report from John Holtz (east coast of the USA) of
a meteor outburst between July 18, 1h50 UT and 2h15 UT, with rates between
1 and 2 per minute. "The meteors may have been concentrated around
the Big Dipper, Draco, Bootes, and Hercules area. All of them were heading
due south, so we couldn't determine a likely radiant."

This outburst shows in the radio observations of Enric Fraile Algeciras,
the University of Ghent, and Maurice De Meyere (detailed report next month),
but not in those of Werfried Kuneth. Probably this can be explained by the
difference in geometry, the former stations receiver-transmitter direction
being roughly west-east, but Werfried's direction being south.
This can be an indication for a radiant low in northern direction observed
from Europe.
Also on (meteorobs) Jin Zhu <zj@bac.pku.edu.cn> mentioned the radiant
associated with near-earth-asteroid 1997 BR, with maximum rate around
July 19 and theoretical radiant near R. Asc 175 deg, Decl +65 deg (Epoch 2000),
and atmospheric velocity of 16 km/s (calculation Rob McNaught).
This radiant could fit the mentioned visual and radio observations.

3. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio
meteor scatter observations and data reduction. It started in August 1993 in
order to spread rapidly the Perseid results via E-mail. Since then, it has
appeared monthly, and it has gradually been expanded. In regularly publishing
summaries of observations, potential radio observers are kept up to date of
existing installations, possibilities and limitations of radio meteor
observations. In the long run, there should be sufficient observing stations
to cover the whole globe, allowing to detect stream outbursts which may
remain unnoticed visually.

RMOB contains typically: summaries of recent observations, equipment data,
first results of stream activity by radio methods, relations between radio
and optical meteors, references to other publications in the field of meteor
astronomy and radio scatter techniques, announcements of meetings, short
questions and answers, non-commercial (second hand) sale of radio equipment,
available software.

Contributors are mentioned, and interested persons are asked to contact them
directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or un-subscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

Actually, that would be something of a reversion to past practices.
When I first got licensed in 1968, you had to have been licensed for
25 years or more to get a 1x2. Then, after the original "vanity call"
disaster in 1975 and 1976, they made 1x2 calls unavailable until
the most recent incarnation of the process.

I think that what you propose for hams with 20 years or so of
experience would be a good idea. It would restore just a little
bit of tradition to the process, amid all of the changes.

You can say that once Amsat gets their satellite into orbit, but right now it is still on the ground because they couldn't meet Arianespaces price. Amsat is non-profit and the things it has done is 99% volunteer and donations. If a large company treats them unfairly, I think that have a right to complain.

1702. Wraase MRC-17 downconverter

Hello all,
I recently aquired a Wraase MRC 17 wx satellite downconverter. It was manufactures by a company called Wraase in W. Germany in the early 1980's(I think). It receives the 1691 Mhz satellite transmissions and downconverts them to 137.5 Mhz. I don't have any documentation on it. It needs a seperate local ocsillator for it to work. I can build that part of the system without much trouble, if I knew what the frequency was. Does anyone have any information on this downconverter. I would like to find a manual and any other documentation I can find on this peice of equipment. I already have the 137.5 Mhz receiver, a satellite dish and feed horn for this system. Any and all help will be greatly appreciated. thanks. Mitch KJ7JA

<snip>

The way American society is going these days (and may be dragging the rest
of the world with it) is twoards what is called "market based". From this
perspective, ESA's not launching P3D is very understandable - no mon no fun.

Another aspect of the "market based" paradigm is that there is a clear and
effective way to indicate displeasure to an entity like ESA. Simply don't do
business with them. If enough potential customers don't do business with them,
they will either change or die - that's what the market place is all about.

The case of P3D, unfortunately, points out a serious weakness in this paradigm.
The market assumes as self-evident that anything of value will have a price
tag. What then is the price tag for the amateur space program and who will
pay it? The same question applies to the Amateur radio service as a whole.

Dont' laugh, but I get this great idea of starting a radio station!!!!(perhaps because of the many radio stations I am able to access through my computer and the internet).

First of all, I do not have the faintest clue about this.

Could anybody provide me with advice, comments, books, vendors, websites, etc.

This should not be from the point of view of a corporate setup with lot of access to financing, but rather , a hobby, basement, volunteer type of thing.

I am particular interested in music, and broadcast range should be from NY to Caribbean(you probably guess the type of music)

I am very computer and internet literate, and would like this to be very computer dependent as possible.

Short-wave, FM, AM, etc

Every piece of information will be highly appreciated

Hey, I know a million dollar's US is chump change to you, but what about the fifteen million US owed to Amsat for their developmental contributions to the program?

How would ESA like the bill.....Net 30?

I am sorry for the attitude, but this routine dismissal is get old. I know Amsat is getting a deal....My very maturity is coming forward....This is doing nothing for the frayed nerves on this side of the pond, and the E S A 's now forthcoming bad press.

T +1.5 years and counting.

A little communication can go a long way at this point. Right now the impression I am left with is this bird is never (not an emotional outburst) going to be launched by the ESA and should be parted out to smaller, less ambitious projects.

The Amateur community needs another bird pretty badly over here. The LEO's are jammed with traffic during there passes. I cannot even hear AO-10...yet...:-)

Off the point perhaps, but it begs the question about what defines
a "satellite". I would guess that it becomes a "double planet" system
when the centre of rotation for both bodies is outside the radius of
either.

1711. NOAA Sats & Polarisation Questions

Newsgroup: rec.radio.amateur.space
Date: 1998-08-08 00:00:00 UTC
From: Graham Seale <see.sig@[127.0.0.-1]>
Message-ID: <3c36637248%Graham@southlin.demon.co.uk>
Source record: 15635

This is about the sense of circular polarisation. I have been reading
articles which seem to have conflicting definitions. I realise this
is a real hazard area for ambiguious descriptions such as "the twist is
clockwise as viewed from the end" but I will have the truth of it
in the end.

Quoting from the ARRL Antenna Book 17th Edition page 19-9

'Polarization Sense is a critical factor, especially
in EME work or if the satellite uses a circular polarized antenna.
In physics, clockwise rotation of an approaching wave is called
"right circular polarization," but the IEEE standard uses the term
"clockwise circular polarization" for a receeding wave. Amateur
terminology follows the IEEE standard, calling clockwise
polarization for a receeding wave as right-hand.'

Reading further we have..

'In working through a satellite with a circularly polarised
antenna, it is necessary to to have the capability of switching
the polarisation sense. *This is because the sense of the received
signal reverses when the satellite passes its nearest point to
you.* If the received signal has "right-hand circular polarisation"
as the satellite approaches, it will have "left-hand circular
polarisation" when it recedes.'

Eh? Can this be true, and if so, why?
The Doppler shift changes, sure.. but this??

I know that the polarisation sense changes when *reflected*, such as
happens in a dish feed, or in EME work, but I have a problem with that
last statement.

I read that the NOAA satellites have "Right circular Polarisation".
So I want to know if this means I construct a quadrifilar helix
antenna looking as if it has a "left hand thread". Will it twist
anticlockwise as one progresses from the end nearest the ground,
up to the top, when viewed from the starting end.

Come to that, suppose one sees a helix antenna, and recognises the
chiral sense as being the same as a conventional bolt or screw fixing
(known as "right hand threaded"). Which definition of antenna
polarisation would such a helix conform to?

Thanks for any lucid help.
Regards all

Er.. Even if I accepted the notion that that the international effort,
contributions, hopes, dreams et. al. of thousands of hams be manipulated
into a US politician's absurd fantasy, and hence provide an platform for
(US only) hams on the grounds that other AMSAT organisations would have
a low interest after the robbery... (not!)

But what about the ten to fifteen million US owed to Amsat for their developmental contributions to the program? I am a very big advocate of the "Market Based" system. But one thing that you might be mistaken in, is that in such a system, skilled labor rules. "Will work for launch" is a very real situation here.

about.

It goes a little beyond this. If Amsat is owed for work done, the bad press will very detrimental to the ESA..... Who wants to work with a agency that does not reimburse you for work done? This is the skilled labor they are playing with. The press issued to this point certainly does not look good for the ESA.

$15M is not very much compared to the cost of a single launch ($150M?)
or the cost of a standard commercial development ($400M? $1B?). In the
scheme of things, AMSAT just doesn't have the economic clout to make
much difference. As for "skilled labor", it is simply a commodity to be
manipulated, just like capital, material or property. For example, in
this country, the response to a shortage of locally available skilled
labor (and the resulting high price) has been a proposal to modify
emigration quotas to allow more people to emigrate IF they have
the appropriate skills!

True as far as it goes. The problem is that potential customers will evaluate
ESA as a potential supplier on the basis of the available capability, the cost
and the probability of success. Bad press might have a minor effect on the
potential buyers estimate of the probability of success, but ESA's record in
terms of launch success (the service they are peddling) is as good as anybody
elses (with the possible exceptioin of the Chinese!).

not to mention how to actually use a console, carts, etc right????

>Could anybody provide me with advice, comments, books, vendors, websites,
>etc.
>
>This should not be from the point of view of a corporate setup with lot of
>access to financing, but rather , a hobby, basement, volunteer type of
>thing.

well....regardless...it's gonna take more than a few hundred
bucks...not to mention a sincere commitment. broadcast quality gear,
even used is NOT cheap....not to mention a tower and a piece of land
for it...power is a consideration...this is no easy "i'm on the air"
solution now....you better be serious with this.

>I am particular interested in music, and broadcast range should be from NY
>to Caribbean(you probably guess the type of music)

maybe possible....and even possibly realistic....but more likely more
of a long term goal than initially.....depending on your backers. I
would focus more on a community oriented radio station, as you'll have
a better chance of getting a license from the FCC or DOC(in canada) as
low power stations are being licensed within the US, and apparently
canada is following suit to some degree...I would say probably under
10 watts of power.....which will save on a monthly power bill...

>I am very computer and internet literate, and would like this to be very
>computer dependent as possible.

so am I but.......

well...as far as i'm concerned....that what you want to stay away from
as much as possible for a community station....you want people not
computers....commerical radio has enough automation....with computers
running programs costing in the 1000's....though you could go the
cheap route I suppose......if anything, at a community station....you
should have a cart deck and reel machine right along with a hard
drive...and I have yet to see any commerical station totally get rid
of their analog console....right now, it's a combo of "both the tried

and true...and some of the new" and you have to look at it that way....because if the comp crashes...and I have seen it...and have been in the middle of it at some commerical stations...you DON'T want dead air...you go to CD players.....carts, reels, whatever.....the key here is NOT TOTALLY DEPENDENT on a computer....rather foolish that way!

>Short-wave, FM, AM, etc

go for low power FM community radio...if anything!!! and you can play all kinds of different music...which is what community radio is isn't it????
>Every piece of information will be highly appreciated

well...I hate to burst your bubble, but these are realities that need to be addressed...do something different than computer automation....for anyone remembering the old days of personality radio, it's the "hands on" approach of radio.....cueing the records, shoving in the carts....all part of it......NOT sitting there and letting the computer play the tunes, liners, etc!!!

What you want to do requires FCC licensing, and the cost of such licensing is of corporate proportions. Secondly, even legal, unlicensed FM stations have a limit way under 1 watt, so your coverage might be a couple of hundred feet away from your house on a good day, and even that might be beyond the range limit for low power FM stations. The fines for non-compliance are very heavy.

Even if you get a cheap transmitter, and a simple antenna, and some simple mixing equipment, it could end up costing you big time anyway.

Well, let's see here - if you want to start a "real" radio station,
you know, the kind that transmits to radio receivers then you need
to talk to the FCC regarding their policies - if you want low power,
then Part 15 is all you need to concern yourself with (100 mW, your
antenna under 1 meter long). If youwant anything larger, say,
500 Watts and up, then you will need to get with a communications
consultant/lawyer and start the process...

If you want to start an Internet radio station, one that broadcasts
packets across the internet to other computers, then what you will
probably want is a recent copy of Red Hat Linux (which includes a
copy of RealAudio Server software) and then work on getting a good,
high-speed internet connection and a permanent IP address.

Please clarify which you want to establish, neither are cheap.

If you want to set up a pirate radio station, i.e. one that is
not licensed, then youshould checkpout rec.radio.pirate (I think
that is what the group is called).

Good luck,

Ken

Common misnomer: if it's on the internet alone, it's by definition, NOT a
RADIO station, as the signal does not travel over radio waves as its primary
path of travel.

Good luck!

> > Short-wave, FM, AM, etc
> >
> > Every piece of information will be highly appreciatedOK, you have gotten into a very hard area. First, you could start a AM
station. To get the kind of range from NY to Carribean, you would need
a 50,000 watt transmitter. These are very expensive. I recommend you
download a free package of software to help you find the range on SW and
AM. You can find this at the FCC's website. Go to search, enter HF,
find the HF Services page, and you will find something. Go to
Continental Electronics page. Next, you could go FM, but it would be
extremely hard. To get coverage from NY to the Carribean, you would
have to buy lots and lots and lots of translators. And don't forget the
license fee, which would cost LOTS a year with all those translators.
You can try SW, which may be the most economical radio signal way of
doing it. To get on SW, you will have to buy an expensive SW

transmitter. 50 kW is fine. (YOU WILL ALWAYS NEED AN ANTENNA UNLESS YOU ARE DOING COMPUTER BROADCASTING!) However, you could to net broadcasting. This costs about 10,000-25,000$, requires computers, etc., and can span the world.

1729. RS-15 Activity ?

Newsgroup: rec.radio.amateur.space
Date: 1998-08-11 00:00:00 UTC
From: Garrett Waltrip <garrett@relia.net>
Message-ID: <35d0e419.0@news.relia.net>
Source record: 15515

I was playing with RS-15 tonight and could hear myself good
but I could hear no one else.
Is there anyone still active on RS-15?
Skeds?
Garrett B. Waltrip
N7QWT
garrett@relia.net

By US Code Title 47, Sec.227(a)(2)(B), a computer/modem/printer meets the definition of a telephone fax machine. By Sec.227(b)(1)(C), it is unlawful to send any unsolicited advertisement to such equipment, punishable by action to recover actual monetary loss, or $500, whichever is greater, for EACH violation.

The Iridium mobile phone service will be digital, so an analog scanner
will not pick anything up anyway.

--
If only we knew that money is only an idea. There is no scarcity or loss connected to it.
Nothing cost anything.

Hi Garrett,

I have worked RS15 as well, and as you said, nobody save a few CW types are there. When I get my antenna's back together I will work you. What calling frequency would you like to use?

Regards

Christopher Cox

Have you checked out the www.freeradio.org site?

You might also consider starting an internet-only radio station--that way you can be heard around the world by anyone with a computer and the FCC or whoever won't give you any trouble.

Ed

1739. the "old days" of radio (sarcasm)

The "OLD DAYS" !!! i love it! hahahahahahahhaa....

Anyone that is dependant on a computer to do their show FOR them... needs to go to a small market for a year and spin cd's (what cd's there ARE) on a consumer-grade deck and play carts on a tri-deck that only has one slot working (and that one over-modulates).

Dear person Taking God's name in vain and hiding behind an alias,

The ARRL is REACTING to the FCC, nothing proactive here. Yes, the ARRL followed your ideology with great failure. They may actual grow in membership as they follow the opinions the rest of the Amateur community has.

BTW, expect increased Technical testing.

Christopher Cox

Want to play music and annoy people: BUY A CB. Easier, Cheaper, Less
trouble with the law, and you get feed back from your listeners. Truely
interactive radio.
Got something to say worth hearing: Start a pirate station.

not a flame....just advice
whatever you do ....HAVE FUN hehehehe

eliminating the code requirement won't swell the ranks. it WILL cause a bunch of technicians to upgrade to gain HF voice privileges so that will help equipment sales for a very short time. once you add 50,000 new technicians to the already overcrowded HF voice freqs there will be an outcry for more bandwidth ... and the only place that will come from is from the CW portions of the bands ...

so eliminating or reducing the code requirement won't "save" amateur radio or the amateur radio industry it will only prolong it for another decade or so and in the process push CW into ancient history....

for anyone who values CW this is unacceptable.

Then CW will obviously survive and thrive without federal welfare support.
If CW is so good and attractive, it will win the battle of modes in a
free market.

Read the NPRM, the FCC seems to think that CW is fading into ancient history and they intend to give us more room for the digital modes. I would prefer that the cw sub-bands be divided up into cw and digital sub-bands ... digital modes like spread spectrum phone and pactor I believe are the future of ham radio and wireless telecommunications in the world.

I agree that the FCC (and others) believe CW is an ancient art but I also think that they are missing the present day phenomena; CW is enjoying a sizable resurgence. Despite it being "1900's" technology a lot of people are discovering kit building, homebrewing, and QRP all of which are dominated by CW operations ... in fact, if there is any growth in ham radio at all it seems to be in that segment of the hobby.

As for digi-ops I have come to the conclusion we are too late. I don't think spread spectrum will be in use on HF ... it seems better suited to VHF-UHF (and up) and yet those are the portion of our spectrum that industry has its eye on. I don't think there is any commercial interest in 160-10 meters.

The dominance of 1200 baud packet on our VHF/UHF bands is plenty of evidence (for me) that amateur digital communications is MUCH more "ancient" than even CW.

Its a pity too because hams could have led the digital revolution but when it comes to digital operations hams are at least two decades behind and going nowhere.

Any statistics on the number of organizations that have lost money as a result
of Arianespaces fraudulent business practices?

I can think of a couple, with Amsat being the most recent.

I never heard of "Arianespaces fraudulent business practices". The
fact that Arianespace launches over 50% of the geostationary comsats
shows that the satellite industry likes to do business with them.

>I can think of a couple, with Amsat being the most recent.

Can you name some, or at least one, of them?

Arianespace desperately needs to demonstrate to the satellite industry
that the Ariane 5 is able to launch standard geostationary comsats
into a perfect geostationary transfer orbit. Because of this they'll
have to launch a dummy of a typical geo comsat instead of the custom
built Amsat-3D.

Hello,

Thanks for reading this message.

Can anyone please help me to obtain a set of plans to construct an Eggbeater style antenna for the 144 and 432 MHz band to work the amateur satellites.

Failing that, can someone provide any information on where I might be able to get one in the UK.

Thanks for any help.

You read things into th NPRM that others don't see thate at all, if you ignore all the hype that has appeared on RRAP and other no-code sources. FCC says that *everything*
pertaining to CW in up for discussion, ant they intend to evaluate comments before making a final decision on it's future. That is exactly as it should be and I'm sure they will have plenty to evaluate.

Just like the rest of us. The difference is that you evidently haven't had sufficient life experiences in growing up with all the digital stuff so that you understand it's limitations and weaknesses. None of it is bulletproof and anyone who says it is, is simply wrong for whatever reasons may exist. Maybe somewhere in the future this statement will cease to be true but for the forseeable future is simply a fact.

So what do we do to solve this and get back on track? Curse those who believe that CW has value that merits it retention because of it's simplicity and universiality within the hobby?

There are PLENTY of us that are more that receptive to experimentation and use of any viable new digital mode. But it's folly to expect us to become instant digital engineers just to do it. That's the gist of what I see among the advanced technologists posting here.

If anyone has a new system they want to test, or software that he needs or wants help testing on the far side of an HF RF link, email me and I will certainly do whatever I can to assist. And I have several computers any of which I can dedicate to it, from 8080 and 486 to Pentium 200MMX. I'm retired and will be able to dedicate considerable time to any such project, at about any time of day needed.

I've said it many times before---THE BALL IS IN THE COURT OF YOU GUYS WHO SAY THIS IS SIMPLE AND SHOULD BE DONE. At least some of us willl be glad to involve ourselves most seriously in helping get it done.

That doesn't change my appreciation of CW or my belief that hams should learn and be able to use it at some skill level.

I for one am glad to see that they are thinking about changing the license classes. Morse is a thing of the past. I myself learned enough morse just to get on the phone bands and to use pactor. I do not and will not use morse any more.

The way that license classes are set up now, is like the fcc giving a crutch to morse just to keep it going, because it is so old and feeble.
Just my 2cents worth!!

No HF skywave communications is bulletproof but some of the
digital modes have a 20dB advantage over CW.

I agree 100%. But I believe hams should be convinced, not coerced into it. Take
away the Morse code testing and CW myths and hams still have a pretty good mode.

Just like antique cars are a thing of the past. Some of the antique cars
of the present are in better shape than when they rolled off the production
line. The same thing is true of Morse code. The top CW operators of today
are every bit as good as their predecessors. IMO, as long as amateur radio
is alive, so will CW be alive and well just like AM is alive and well on
75m.

> The way that license classes are set up now, is like the fcc giving a crutch

It is old but not feeble. I will do my part to keep the mode alive but not
the testing. I agree with you that it doesn't need a crutch. But there's
nothing wrong with CW, the mode, just with the CW testing requirement and
the CW myths.

Cecil,

Those are my sentiments exactly and I'll tell you why....

Lets assume the *worst case* scenario for ham radio. Lets assume nobody new wants to join the hobby anymore ... and all the oldtimers are dropping like flies from old age. The hobby shrinks to the point that the FCC simply dismantles amateur radio.

In that scenario, I believe there will still be a core of experimenters, inventors, tinkerers ... the kind of person that actually started the hobby in the first place. Those kindred spirits will build small radios which will probably utilize CW as the basic mode of communication.

You won't be able to purchase a commercial radio so that *natural* process will weed out the untrained and what will evolve will again be the homebrewers and the hobby will be reborn so to speak.

If it is illegal then clandestine groups will make schedules via the Internet and meet on illegal frequencies for short QSOs.

Whether we like to admit it or not THAT is a pretty close representation of how ham radio started (without the Internet of course). It hasn't ALWAYS been legal and yet there have always been those hardy souls who have plowed ahead with innovation in the hobby.

To a degree, I believe ham radio's popularization by the ARRL and other well meaning groups have adversely affected the hobby ... for once something becomes popular enough to be profitable then business gets involved and now ham radio leadership organizations seem to be pandering to commercial interests. Discussions seem to center on "how can we make the hobby grow so Kenwood, Icom, and Yaesu won't abandon their ham radio line of equipment".

In most cases, this is self-serving since if Yaesu and Kenwood go out of business the ARRL loses advertising revenue....

I have nothing against new blood joining the hobby but I am pragmatic enough to realize that people get involved with amateur radio for one of two reasons:

* they love to build, experiment, and learn about the art of radio and communication

or,

* they love to communicate

Now you don't need to learn CW if all you enjoy is communication and if that is all the hobby has evolved to then I say lets abandon CW today. But then if ALL someone wants to do is COMMUNICATE then there are many, many, many more ways (like the Internet) to do that efficiently these days and none of them require an amateur license. Ham Radio can't compete at all in that limited arena and it is foolish for us to even try.

Yeah...I remember when one had to pass a test to be able to use a buggy whip or a slide rule. Sure was a sad day when they dumbed down those requirements and deleted those exam requirements....

N O T ! ! ! ! !

What in the tarnation does a buggy whip or a slide rule enthusiast have to do with Morse code anyway? Oh yeah, anything anyone doesn't like nowadays is deemed antiquated....Geeze....sorry I forgot about that.....:)

One of my pet peeves is hearing someone say that anyone is coerced
into anything in amateur radio. C'mon Cecil....no one ever held a gun
(that I know of) to anyone else's head to get them into this hobby....

It's as if this whole code-no-code issue has become a life or death
issue...it's rediculous.

Well, you make a good point for 5 wpm as a requirement, so that the experimenter has a good base. But what logic would you use for code requirement faster than 5 wpm?

I love to tinker, yet I am a no-code tech. It bothers me that I cannot pick up a key and start transmitting, if nothing more than to practice. I think I have 5 wpm down and would like to put a 2n2222 rig on the air.

I have seen too many code appliance operators around to be pro-code advocate. For code to be a barrier to the tech types and allow these guys to have all the DX fun sort of burns me up.

There are other ways of coercing - witness the IRS. My dictionary says
that "enforce" is a synonym of "coerce". The Morse code requirement
is certainly "enforced".

I explained that above. For anyone who valued buggy whips, the
demise of horse and buggies was unacceptable. For anyone who
valued slide rules, the rise of the portable calculator was
unacceptable. Time and progress marches on. Finding that
unacceptable and a buck will get you a cup of coffee.

YOU CAN OPERATE CW WITH A TECHNICIAN LICENSE ABOVE 50 mhz.
No NEED for even trying the 5 wpm code exam for a tech to operate cw
in your allocation bands over 50 mhz.
At least here in the USA. try 6m cw or even 2m. You will need an all
mode rig or a cw only transmitter.

If you are located somewhere in the middle of, say, NY and Jamaica, heres what you could do.

A). AM Radio, low power, 10,000 watts: This will give you coverage of a metropolitan area.

B). AM Radio, 50 kW. Will send your signal down through the east coast and the carribean in the night.

C). FM Radio: You will need around 100 translators. This will cost tons of money a year thinking of all the translators needed.

D). SW Radio: If you have a 50 kW Transmitter, you would get perfect coverage. Register a 9 or 11 MHz Frequency and you will be fine. This would cost $2300 a year for a license, I do not know transmitter costs, however much electricity is used.

E). Satellite Radio: Satellite Radio Space is expensive, but works well.

F). Internet Audio: Sending radio via the Internet is cheapest, and works best. However, many people in the Carribean do not have internet access.

Hey Chris... It burned me up too, a long time ago. In fact it such a fire under me that I learned code and got a *real* ham license - you know, one that let me do all those neat things.

It's very difficult to get used to the fact that today, when one wants something so badly, he refuses to find out what the requirements are and proceed to meet them. Instead they complain how naughty and evil the gov't is for making it so "hard". Funny, I don't remember it being so tough. Was even a bit of fun. Makes me wonder what things are coming to. People, that is.

go check the history, dude. when all the good opportunties existed for people to break into digital communications and score another one for amateur radio, we had rules that restricted what we could do to basically 60 WPM 5-level code.

everyone else moved to ASCII and hams were still stuck running Baudot...

I won't argue that there aren't digital modes which are better than CW, But all you need to copy CW is a pencil & paper. Now, If other digital modes are to replace CW, then I propose that all prospective hams need to own a computer and buy a $300 dollar multi-mode TNC before their license can be issued. I've never met anyone who could copy RTTY or packet in their head.

CW makes it more difficult to obtain a license, people generally appreciate things more when they are difficult to get. Having the license handed to you on a silver platter cheapens the hobby and invites trouble.

If you had to build a transmitter due to an emergency situation, a CW transmitter is easiest to build, and can permit worldwide communications even in the toughest band conditions. Try that with your pactor.

When CW is eliminated, then CB will increase by nine "new" bands and you'll hear "echo boxes" & "roger beeps" on your $1,000 rig as you attempt to work your best friend on pactor, and you shut off your rig in frustration.

Long live the KING, Long live CW!!!

Pure Bullshit! You need a transceiver just like any other RF mode. Most
modern transceivers have computers built in. On top of the electronics
needed to send/receive CW, which is identical in kind to the electronics
needed to send/receive digital modes, one needs to spend many hours learning
how to emulate a modem. If all that floats your boat, feel free. Just don't
expect the rest of the human race to share your likes and dislikes.

> If you had to build a transmitter due to an emergency situation, a CW
> transmitter is easiest to build, and can permit worldwide communications even
> in the toughest band conditions. Try that with your pactor.

An FM transmitter is just as easy to build and would allow local emergency
communications which would alleviate the delay in someone halfway around
the world applying for a visa so they can come to your rescue.

I sometimes give up on CW, turn the problem over to PACTOR, and
go to bed. When I wake up, all refreshed, a perfectly formatted
PACTOR message is waiting in my mailbox. PACTOR is my backup for CW.

CW is useful and fun for some people. You don't have to tell falsehoods
about CW's impossible capabilities or trash the other modes. Let
everyone who wants to use CW, use it. What is wrong with live and
let live?

W6RCA is another blithering idiot, (A new candidate for the ARRL Board)!!!

For any aspect of ham radio you need a transceiver or separate TX - RX.

For digital you also need a modem and something to handle the protocol,(either
a computer or the firmware of a TNC.

Cecil, w6rca@ibm.net stuck his head up his ASS when he wrote:

>Pure Bullshit! You need a transceiver just like any other RF mode. Most

>> If you had to build a transmitter due to an emergency situation, a CW
>> transmitter is easiest to build, and can permit worldwide communications even
>> in the toughest band conditions. Try that with your pactor.

Cecil then tried and failed to pull his head out of his ASS when he wrote:

>An FM transmitter is just as easy to build and would allow local emergency
>communications which would alleviate the delay in someone halfway around
>the world applying for a visa so they can come to your rescue.

The FM TX is still more complicated and also requires a more complicated
receiver. Most shortwave receivers don't have a discriminator, but many do
have a BFO. I suspect the reason why someone would build a cw tx is because
the EMP would destroy thier other ham equipment.

Cecil displays the motivation of the No-Code movement when he writes:

>I sometimes give up on CW, turn the problem over to PACTOR, and
>go to bed. When I wake up, all refreshed, a perfectly formatted
>PACTOR message is waiting in my mailbox.
>
The motivation is called: LAZINESS!

Exactly! CW cannot be done with pencil and paper alone as was alleged.
If you guys would just avoid all those outrageous claims for my favorite
mode, I would not have to challenge your myths. My feelings are also with
CW, but my rational mind is that of an engineer who knows faith is
not a tool of knowledge. CW is not some metaphysical miracle. It is a
mode, and like any other mode, is subject to the laws of physics. CW
does not always get through. If you cannot hear it, you cannot copy it.

Said destruction including those BFOs. All my shortwave receivers have
discriminators. One of my spares is packed in a metal trunk and the
other in the metal tool box on my pickup.

It does not take a 300$ multimode TNC use CW digitaly or to
use other digital modes. They help under some condictions of couse.
A simple sound card can do the trick.

>issued. I've never met anyone who could copy RTTY or packet in their head.

True enoungh statement. CW makes it more difficult to obtain
a license.

>things more when they are difficult to get. Having the license handed to you

Why do you want them to focus on the stupid license? The
license is the least valuble thing we hams gets out of ham Radio. (I
hope that is genraly true, I am not certain that is the case with some
people and that is problem)
>on a silver platter cheapens the hobby and invites trouble.

Five wpm is no code. A cub scout can learn Morse code at 5 wpm in a
week.

So it took you two hours as a cub scout to learn Morse code, but you
feel that it's more than the average ham in 1998 can handle, and your
PhD friends shouldn't be forced to endure it.

Makes sense to me Cecil......

Go to my Web site.
I just started a NetRadio, I have everything and I'm Already online, but need some help from you guys.
I need topic.
The show is audio and pre-recorded, but since I just started I need topics.
I want to make it and open topic, but I need for people to e-mail in there topic for next show.
if you want e-mail me and I'll show you how to get started on a internet radio (al lease pre-recorded), because live is expensive.

point your browser to: www.mindspring.com/~candela/1page.html

and click on CanDeLa's NetRadio

Thanks

CanDeLa

Tom@astro.net wrote:

> You know, this amazes me. I finally upgrade to tech plus, I did my 5WPM
>test and the higher class folks STILL complain it's not good enough.

Nobody's complaining, Tom. Just stating facts. Five words per minute in NOT
good enuff to communicate using Morse code. And where do you get all
this 'higher class' stuff, may I ask ? Who said anything about classes here,
we are discussing Morse code.

>I've been trying to get over 10WPM for the past 2 years.

You should try more often than 5 minutes a month. Taking about how
hard it is does not constitute 'trying'.

>Getting to 13 does NOT make anyone better for pet sakes.

Certainly it does. 13 is MUCH better than 5, but it still puts most good CW
ops to sleep.

>I'm not against using code, just the testing of it.

I'm not against using drugs either. I'm just against drug testing.....

>I'm still plugging away at the code but I really think it's BS.....

There you go, Tom, you figured out your problem. You THINK something
is BS, but you are trying to learn it. Right. Anybody who thinks anything is
BS will make an honest effort to learn it. Sure. Let me check my drivers
license and see if my birthdate says 'YESTERDAY'.... You aren't studying,
you aren't trying to learn, you are 'plugging'.....

Fact is, you think code is BS, so you don't want to take any more code
tests. Admit it, you'll feel better..... Go join No-Code International (tm),
they'll lead you to green pastures and they'll take care of all the plugging,
you won't have to plug at all anymore.

I know what you mean, Chris. I love to fish. Every time I go by the mariana on the other side of the island, I see some SOB sitting in a deck chair on his 45' Bertram. Bunch of fishing rods stuck in the holders, each one has a $2000 Penn International reel on it. It really burns me up that these guys with all the bucks get to go fishing every day and I have to stay on the beach......

I wonder if the welfare department would by me a boat, just because I really, really, want one.....

Anyway, there are LOADS of CW ops above 20 mhz. Listen to 15 meters the next time the band is open to Europe.....

First I said:

> Five wpm is no code. A cub scout can learn Morse code at 5 wpm in a
> week.

Then "Christopher Cox" <cobox@netexp.net> wrote:

>Yep, Code requires about that mentality, regiment, self control, for no
>reason at all....just because...Work hard for minimum wage, minimum
>output....Shesh..Its no wonder people look at these guys like a bunch of
>reelects...Hard work towards nothing....Well, here ya go, this is what you
>deserve, nothing.

Cecil, W6RCA, a proponent of the no code HF license, said my first statement was incorrect. He said he learned 5 WPM as a cub scout in two hours....

Nothing in your book, Chris, not necessarily in mine. I can operate on any frequency on any ham band, and I have had thousands of enjoyable CW contacts on HF. So the little bit of effort that I spent passing a few tests seems well worth it, to me anyway.

Turn what you just said around, and think about it for a few minutes, Chris. Maybe some of the people who are opposed to no code HF licenses have the same view you do, only backwards.

Anything in life worth having requires some effort to get it. The people who are willing to expend the effort have it, and the people who are not willing to expend the effort don't.

>Well, I will give you one thing Jim, at least you are not hiding behind
>some alias....But why is it you pro-code guys all come from juno, webtv,
>dejanews. It could be you are moving, but the others seem to be hiding and
>using aliases.

>Christopher Cox
>KC8FRJ

Thanks, but why is it that you think I'm one of those 'pro-code' guys ? Did I say that ?

I don't know about WebTV, Chris, but Juno is free, so that's why a lot of hams come from there. I come from DejaNews on your screen, but I really don't come from DejaNews. I've been here more than 15 minutes and I can spell SPAM. DejaNews eats my share of SPAM for me.....

I'm not moving, I've been on the same island for 15 years, and if you send an email to the DejaNews address, you'll get a reply. Most people who are hiding behind an alias are doing so because they are afraid to have their opinions connected to them. That's not me, for sure. Plug KH2D into a search engine, and you'll see I'm doing a really bad job of hiding.....

Jim, the FCC (who might be considered the "real" authority on what is code and what is not code), considers 5 WPM to -be- code. So much so, that 5 WPM and a simple written exam will earn that cub scout HF priveleges from 3675-3725, 7100-7150, 21100-21200, and 28100-283500. But you, who have no regulatory authority over the amateur bands, say that 5 WPM is no code. I'm going to go with the FCC on this one.

No, it's not more than the average ham in 1998 can handle and yes,
my PhD friends shouldn't be forced to endure it. I consider CW
a very useful and fun mode and urge every ham to learn it and try
it. Yet I consider Morse code to be an immoral governmental requirement.

I do not believe in forcing my favorite mode on anyone else. Why
should everyone be forced to pass a motorcycle test before they
can drive a car? If you don't understand that, you don't understand
Libertarians. The least amount of governmental requirements that
work is the best amount of governmental requirements and a secret
handshake/hazing ritual/tradition/Good Old Boy network has no place
in allowing access to a limited resource owned by all citizens of
this country.

By all means, test what is necessary. Morse code testing above
5 wpm is unnecessary as evidenced by the existence of extremely
qualified waivered hams.

It wasn't supposed to be exciting. I was doing N5AQM a favor while he was on sabbatical. I was his free wireless ISP while he was away from his telephone. PACTOR stayed on the job 24 hours a day for 4 months through all kinds of conditions. CW failed to function after only a few straight hours. :-)

If it's so easy, how is it a feat of endurance? If they spent the same
amount of time on learning the code that they do complaining about it,
they'd all be extras by now.

>

Maybe they should. ;-) Then so many car drivers might not be causing
problems for the motorcyclists. Ask any biker what the biggest danger to him
is and he'll tell you it's the motorist who doesn't see him, cuts him off,
doesn't understand the different stopping distances needed by a motorcycle,
etc. But that's a different subject....

If you don't understand that, you don't understand
>Libertarians.

Guess not.

The least amount of governmental requirements that
>work is the best amount of governmental requirements and a secret
>handshake/hazing ritual/tradition/Good Old Boy network has no place
>in allowing access to a limited resource owned by all citizens of

>
I don't think a code test is a secret handshake or hazing ritual. If having
a basic skill that can be used to communicate with is a tradition, then what
is wrong with that? If by Good Old Boy network you mean a group with
fellowship and a common bond of experience and interests, then so be it.

I do like your pointing out that the spectrum we enjoy is a public trust
that we should have acess to as citizens. Enough of that public service and
technical experimentation stuff. We shouldn't need to justify Amateur

radio -- as citizens, it's our spectrum.

>By all means, test what is necessary. Morse code testing above
>5 wpm is unnecessary as evidenced by the existence of extremely

>--

The higher tests are unnecessary. Noone is forcing anyone to become a General or Extra.

The sad thing is the lousy frequency assignments given to the novices. The worst parts of the bands that noone else wants. Noone to talk to there. If they were able to communicate lowwer in the bands where they might enjoy it more, we might be reading about how many novice licenses were issued, instead of how few.

Throw a few A & F words in there Cecil, and you'd sound exactly like
our dear departed friend, Squiggy.

>By all means, test what is necessary. Morse code testing above
>5 wpm is unnecessary as evidenced by the existence of extremely
>qualified waivered hams.

Why is 5 WPM necessary ? Why not change it to 3 WPM or 2 WPM,
why's it gotta be 5 WPM ? Is five OK because you learned 5 WPM
as a cub scout in two hours and you figure that 5 WPM shouldn't be
a barrier to the average moron who wants a ham ticket ? I doubt
most people are worried a whole bunch about those 'extremely
qualified waivered hams', I think they're probably more concerned
about the extremely unqualified not waivered ones....

You know, this amazes me. I finally upgrade to tech plus, I did my 5WPM test and the higher class folks STILL complain it's not good enough. I've been trying to get over 10WPM for the past 2 years. Getting to 13 does NOT make anyone better for pet sakes. It just means they can copy faster. Big deal. I'm not against using code, just the testing of it. At the very least they should drop the 13WPM general test to 5 or 10wpm. I would rather be made to learn more technical material to upgrade than have to do code, THAT would make me a better ham. You know how many people go NUTS to pass their Extra and NEVER use a key again? Just so they can say "I'm an extra"? Like that's such a big deal.

I'm still plugging away at the code but I really think it's BS that they still test it. Drop the code testing speeds or eliminate it and add more technical questions, that seems fair to me.

Maybe since he is such an intelligent person that he should not be "forced" to take the written test either. Just open the box, sign you "X" at the bottom and grab the mic and call "CQ SKIP LAND".

Great if all you want to do is communicate while everything is perfect. It like the internet, there isn't really any "fun" using the internet or these news groups. Your computer does all the work and all your left to do is type. The fun is making a contact with you own skills and not rely on mechanical/electrical equipment to do the job for you. When I make a RTTY/PACTOR/AMTOR/GTOR contact I don't feel that I have accomplished as much as when I make a contact on CW. With CW I have to use my brain to decode the dits and dahs and not rely on something else to do it for me and to use a CW keyer "you" have to form the dits and dahs. When there is no challenge in a contact then all the fun is gone.

What does grabbing a mic and working DX have to do with TECH types. If you
want to get into the hobby to do technical work then a tech + will do you just
fine. If you want to work DX try six meters. The band was opened last night
and there was many stations there working DX. Code is no barrier unless you
want it to be.

Funny you say that. The past two nights I have been on 15 "CW" and only had
to call CQ once to get a response. Same on six meters last night. Worked a
station in Canada in the CW portion of six meters. Go and yea shall find.

You dead wrong Jim. If and when I get to 13 I will certainly take the test.
Your attitude is terrible though. You flame me for my opinions, bust my chops

because my opinion differs from yours. I continue to work on my speed and you STILL bust my onions. Way to go. Your being a real big help to the hobby. I know about NCI, haven't joined. I do think the FCC and ARRL are finally seeing that the code is not helping the ham ranks today. Upgrading is down. Tech numbers are up. It doesn't take a brain surgeon to see the problem. Something has to be done. If they lowered the code speed for general I'll bet there's a BIG influx of us Tech pluses upgrading. Lower the speed, add more technical questions. What's the problem? It doesn't lower the standards, if anything it betters the standards, makes us more technically up to snuff.

Uhh, Jim I am stuck at 50Mhz and up. I have heard some CW calls on 50.200, but that is about it. I have ventured down to the 10 meter band and there is not allot of CW, if any, there either. Hey I would love a CW practice net on 6 meters.

As for your insinuation that I am looking for welfare, get a grip. You have not demonstrated a compelling reason CW is a better or worse mode for communication. Indeed, anyone can jump on 15 or 20 meters and work the world. That would be fun, fun that I would like to have, but requires zero talent. What freq.'s do you hang out on.

How many meteor sched's have you run? How about SAT's, that is what this newsgroup is about. How about some 6 meter work? What kind of tinkering have you done to work a Sat. How about any of the digital modes, or SSTV or better yet just NTSC.

And for that matter, why are you cross posting here for anyways, do you have some method of lofting P3D, hey I am all ears.

I gave you a cookie, I have learned 5 wpm, but that is not good enough for you, fine. What have you done for HAM Radio lately....with your key....

Stay logical, I will listen. So far your condescending attitude over a on-off mode is buying you nothing.

Jim,

I have no problem with working for something, but what is code going to buy me. I deplore wasting time, you learn that when you own your own business. I do understand its use with minimal equipment, and is the one reason I am learning it, obviously not to *your* satisfaction. I do want to play on H.F. with a home built rig. Work the world with a couple transistors. From what you stated, you will not be answering my CQ because it will be to slow for you.

What is your logical reason for CW usage?

Hey, I had my novice ticket 25 years ago, as you put it anyone can memorize - . but NOT really use it.

Christopher Cox

You guys keep implying that you can do CW without the mechanical key and electrical transceiver but I have yet to see anyone do it. Face it, the electronics in a modern transceiver are not appreciably different from the electronics in a modern PC. How you can use electronic transceivers, electronic keyers, and $100 paddles and still maintain that you are not relying on mechanical/electrical equipment is beyond comprehension.

Chris you have to cut ol' Jim a little slack the whole code thing is done, stick a fork in it. Those whose entire self concept is tied up in how well they can TRY to emulate a machine are naturally hurt and confused so they strike out.

Just remember the internet is a place where for about $20 a month you can make as much of an ass out of yourself as you wish. Think of Jim as a guys that wants to get the most he can for his money. I think he'll call me a name now thus making my point much more eleoquently than I ever could.

>net on 6 meters.

You're not stuck. You just decided you wanted to be stuck. There's plenty of
CW on 15,20,40, and 80 meters, plus the WARC bands. There will be plenty
on ten meters when the sunspots start working again. Bust out you code tapes,
go download a CW program, get your speed up and go where everybody is,
instead of wishing they'd come to six meters and visit you.

>As for your insinuation that I am looking for welfare, get a grip. You have
>not demonstrated a compelling reason CW is a better or worse mode for
>communication. Indeed, anyone can jump on 15 or 20 meters and work the
>world. That would be fun, fun that I would like to have, but requires zero
>talent.

I am not trying to demonstrate anything, Chris. If you want to jump on 15 or
20 meters, you have to pass a CW test at 13 WPM first. That's not a demo,
that's a fact. I think when or if you do get on 20 meters, you'll find that
working the world requires a lot more than 'zero talent', but that's something
you and a lot of other people are going to get to see for yourself.

>What freq.'s do you hang out on.

HF, six meters, VHF, UHF.

>How many meteor sched's have you run? How about SAT's, that is what this
>newsgroup is about. How about some 6 meter work? What kind of tinkering
>have you done to work a Sat. How about any of the digital modes, or SSTV or
>better yet just NTSC.

Never tried and meteor skeds, Chris. I'm a DX'er from the old school, I don't
believe in skeds or nets or stuff like that. I turn on the radio and work what
I can find.

My satellite career is over, Chris. First I tried the VHF up/10 meters down
ones, years ago. Then some of those funny Russian cross band HF ones.
Then AO-13 for a bit. Next Uo-22, Kitsat, the digital ones. Wanna buy a Trakbox
and a Paccom NB9600/PSK modem ? Packet, RTTY, been there, done that. I still
have SSTV, but I find that extremely boring because the average ham on SSTV has
two pictures. Six months of SSTV on HF, and you've seen every picture you're
ever gonna see. Ever tried to work anybody on SSTV with 20 meters open to Europe
?

>And for that matter, why are you cross posting here for anyways, do you
>have some method of lofting P3D, hey I am all ears.

Cross posting where ? I am reading all your messages in .MISC, where
are you ?

>I gave you a cookie, I have learned 5 wpm, but that is not good enough for
>you, fine. What have you done for HAM Radio lately....with your key....

I don't have a key, Chris. Too slow. I have a few sets of paddles, and a few
keyers, but no key.

You learning CW at 5 WPM didn't give me anything, Chris. It gave you the
opportunity to get started in ham radio. Stop whining and take advantage
of it.....

>Jim,

>I have no problem with working for something, but what is code going to buy
>me.

Well, let's see. 13 WPM will buy you a general ticket, and the opportunity to take the advanced class test. 20 WPM will buy you an extra class ticket if you can also pass the written test.

Waiting might buy you HF someday. But then again, it might not. Wait and see....

Several times you have mentioned you'd like to be on 15 and 20 meters. But you apparently don't want to be there bad enuff to do anything but wait...

>What is your logical reason for CW usage?

It's fun. There are thousands of hams all over the world using it, and you can talk to them. On a day when propagation is lousy, you can usually work a few people with CW that you couldn't work with SSB. In a situation where you are using a poor antenna, and low power, you can usually contact more people with CW than you can on SSB.

>Hey, I had my novice ticket 25 years ago, as you put it anyone can memorize
>- . but NOT really use it.

Sounds like you decided to wait a long time ago.....

After two years of trying, I would suggest that Tom go to a doctor to see
if there is any physical impairment that interfers with his ability to copy
Morse code. 99% of the population don't do Morse code. To the best of my
knowledge, no scientific study has ever been done to find out the facts
about the Morse code capability of the general population.

Source record: 15480

When the model Sputnik was hand lauched from MIR there was a Russian address mentioned here for sending reports.

I duly sent a report in the first week of operation noting the dire instructions about making the envelope look as plain as possible.

Months and months later I have given up waiting for a QSL card so I assume the corrupt element in the Russion PO has made off with my IRCs and thrown away the addressed envelope.

Out of interest, did anyone actually receive a card?

SB SPACE @ ARL $ARLS011
ARLS011 New satellites get OSCAR designations

ZCZC AS11
QST de W1AW
Space Bulletin 011 ARLS011
From ARRL Headquarters
Newington, CT August 21, 1998
To all radio amateurs

SB SPACE ARL ARLS011
ARLS011 New satellites get OSCAR designations

Amateurs radio*s two newest satellites, TMSAT-1 and TechSat-1B, are reported doing very well after a month in space. The two birds were launched jointly in late July from Russia*s Baikonur Cosmodrome. Neither satellite is yet ready for general use as they undergo initial loading of flight software. Both satellites also have received OSCAR designations from AMSAT. TMSAT has been dubbed TMSAT-OSCAR-31 (TO-31), while the Gurwin TechSat 1B will be known as Gurwin-OSCAR-32 (GO-32). The assignment of consecutive OSCAR numbers to new Amateur Radio spacecraft is a tradition that dates from the launch of the very first Amateur Radio Satellite-OSCAR 1. In order for an OSCAR number to be assigned, the satellite must successfully achieve orbit and one or more transmitters must be successfully activated in the Amateur Radio bands. Then, the builders/owners of the satellite must formally request that a consecutive OSCAR number be assigned to their satellite. TMSAT, the first Thai microsat, was constructed by Thai engineers in cooperation with engineers at the University of Surrey in the UK. It*s primarily designed along the lines of a low-earth-orbiting communications satellite. The TMSAT control station in Bangkok is HS0AM. TechSat-1B is also responding well to ground control commands, and the satellite recently took its first picture from space. The satellite contains an ultraviolet spectro-radiometer, a charged particles detector, and a superconductivity experiment, among other experiments. Images from both satellites and access to additional information are available via the AMSAT Web site, http://www.amsat.org. Both satellites are expected to be available soon for general amateur use.

Source record: 15391

Ok everyone! I have just a couple of things to say on the CW thing..... Then I think I'm going to shut up again until the topic gets back to space like it is supposed to be - and by the way - you might wanna make note that all the CW high classes like JIM with his 2X1 call sign - they are all here on the HamSpace mail list - BUT they have no idea of anything except CW!

It would appear to me that since the ONLY thing I have seen Jim or any of his buddies say positive for CW is that you can talk to other CW people with lower power and get thru more noise - this seems like a very small reason to keep something around. We are on here discussing the P3D satelite problems - and problems with getting it launched and this satelite has NOTHING whatsoever to do with CW or no CW other than the fact that most hams trying to make this better for all of you are NOT CW proponents(sp?). This should send a very clear message to the rest.

Problem number two with this situation - I have seen people try to speculate that 5 WPM is NOT in fact, CW. Well, I'm confused as to what makes CW -.-. --.- any different at slow or fast speeds? I find it sounds the same. It is just a little harder to recognize when it is faster. The point here is that if you are going to use CW in a noisey or poor signal situation - it will be equally as difficult to pick it out if you send it at 20 rather than 5 WPM. Taking this fact into point - it would be BETTER to send it slower - wouldnt' you agree? Probably not because we all know that that HIGH CLASS ham will also have HIGHER DOLLAR VALUE equipment and antennas. There are more than a few of us techie people that do NOT have access to that kind of equipment and would benefit from slower CW speed. The bottom line is that if we keep CW requirement at 13 OR 10 or even 5 WPM doesn't change the facts that there is still a requirement for CW to obtain HF licenses. Ours is the only country left in the world that isn't considering the shift to slower CW speed. The FCC plan in their NPRM is to only reduce the speed from 13 to 10. I think we are all crazy to argue about 3 WPM. This is rediculous in my opinnion. But since I have pasted only 5 WPM my opinion probably doesn't count anyway. But so be it. The ARRL has changed their proposal to 5 WPM and I think ther eis nothing wrong with it as long as the technical exam is increased in difficulty.

All this fighting and arguing between classes here is stupid and needs to stop or the wrong person will see it and possibly us it against all of us! Now for the flamers - I'm ready and don't really care. I want HF but not for CW I'm interested in digital modes -- and I'm sorry if CW people odn't consider those REAL HAM MODES but experimenting is what REAL HAM MODE is and digital is an extension of CW whether you want to admit it or not!

I'm finished!

* TMSAT NEWS *
==============
TMSAT commissioning is proceeding, and controllers are currently testing the
earth imaging system. TMSAT has 5 cameras on board - a wide angle camera
(WAC) similar to UO-22, 3 narrow angle cameras with a pixel resolution of
approximately 100m and image size of 1020x1020 pixels, and a video camera
(which will be used for taking still images).

Five images have been taken so far. The first was a test over India under
manual control from Bangkok, and the other images have been taken automatically
under control of the OBC186. The Red Sea was initially since it is generally
free of cloud which is useful for sensor calibration. For the first few
images, only the WAC was used, and the first set of images using the narrow
angle cameras (NAC) over Greece was taken on Friday 1998-14-Aug. Due to the
size of the images, it is taking some time to download as other housekeeping
and commissioning functions must also be scheduled.

Two of the WAC images have been posted to the folowing web address:

http://www.ee.surrey.ac.uk/CSER/UOSAT/amateur/tmsat/index.html

One is the first image over the Red Sea. This was actually under exposed and
has been enhanced. The Nile valley can clearly be seen as can the Nile delta
and the different sands in the deserts of Egypt and Saudi Arabia. The image
is reasonably cloud free, and for a first image is quite nice.

The other image was taken over southern Greece and the Mediterranean Sea.
The southern tip of Italy can also be seen as can Crete and Libya.

* OSCAR-11 NEWS *
=================

It has been an uneventful month for OSCAR-11. During the period 1998-Jul-14 to 1998-Aug-15, reasonable signals have been received from the 145.826 MHz beacon. Telemetry has been nominali, and the battery voltage has improved slightly, averaging 13.7 volts, with values ranging from 13.4 to 13.9 observed.

The internal temperatures have slightly increased and are now 3.4C and 1.8C for battery and telemetry electronics respectively.

A single WOD survey, of channels 1, 2, 3, 61 (magnetometers) dated 01-July-1998, starting at 16:24:09 UTC has been transmitted. This was started at the same time the attitude pulse counters were reset to correct the counter overflow problem mentioned in the last report. It shows the unusually high spin period of 640 seconds.

Reports of the OSCAR-11 Mode-S beacon have been received from Bill K4SNF, Mike N1JEZ, and Micheal OH2AVE, indicating that the beacon is still functioning. Many thanks for those reports.

The operating schedule remains unchanged:

ASCII status (210 seconds)
ASCII bulletin (60 seconds)
BINARY SEU (30 seconds)
ASCII TLM (90 seconds)
ASCII WOD (120 seconds)
ASCII bulletin (60 seconds)
BINARY ENG (30 seconds)

The ASCII bulletin is currently a static message, detailing modes and frequencies of all the amateur radio satellites.

There are additional status blocks after each bulletin is transmitted, and between ASCII TLM and WOD.

The Mode-S beacon is ON, transmitting an unmodulated carrier, but telemetry indicates that it has partially failed, and delivering half power. This beacon is a useful test source for those testing Mode-S converters, prior to the launch of P3-D. It is considerably weaker than DOVE, which should be used for initial testing. Any reports of reception on 2401 MHz would be most welcome. Please e-mail g3cwv@amsat.org.

The 435.025 MHz beacon is normally OFF. However, it can sometimes be heard when the satellite is being commanded by ground control (ie. within range of Guildford, UK). When the 435 MHz beacon is transmitting, the 145 MHz beacon is normally OFF. The data transmitted is mainly binary.

Listeners to OSCAR-11 may be interested in a web site dedicated to OSCAR-11. The web site contains details of hardware required and some software for capturing data and decoding ASCII telemetry and WOD. There is an archive of raw data (mainly WOD) for analysis, which is continually being expanded as new data is captured. Also included are some audio files containing

examples of each type of data transmitted by OSCAR-11. Each one plays
for about ten seconds. There are also examples of Mode-S reception.
All the audio files are compressed (zipped), so that they can be played
off-line. These should help listeners identify the various types of
data transmitted by OSCAR-11, and give an indication of the signal
quality required for successful decoding.

The OSCAR-11 Web Site maybe found at the following URL:

http://www.users.zetnet.co.uk/clivew/

* FCC PROPOSES CHANGES TO AMATEUR RULES *
==========
The FCC has proposed to phase out the Novice and Technician Plus class
licenses, leaving just four amateur license classes in place--Technician,
General, Advanced, and Extra. The Commission also has asked the amateur
community to express its opinions on Morse code requirements for licensing
and testing, but offered no specific changes. And the FCC proposed to
permit Advanced class licensees to administer amateur exams up through
General class. The proposals were among several suggested rules changes
and invitations to comment contained in an FCC Notice of Proposed Rulemaking,
WT Docket 98-143, made public August 10.

In proposing to phase out the Novice and Tech Plus tickets, the FCC said,
"there appears to be an unnecessary overlap between the Novice, Technician,
and Technician Plus license classes." The FCC also said that Technician
and Tech Plus operators "predominantly" use FM and packet on VHF and UHF.
In addition, the FCC said Novice applicants last year numbered fewer than
1000, while there were nearly 21,500 Technician applications.

Under the FCC plan, Novice and Tech Plus licensees would retain current
operating privileges, but no new Novice or Tech Plus licenses would be
granted. For examination purposes, current examination elements 2 and
3A would be combined into a new element 3A. For administrative purposes,
the FCC would combine the current Technician and Tech Plus databases into
a single Technician database. The proposal would eliminate the 5 WPM code
test, Element 1A, as a required element for any class of license.

The elimination of the Novice and Tech Plus license classes would effectively
raise the bar for future applicants desiring to gain HF operating privileges,
unless the FCC ultimately reduces Morse code testing requirements. Since the
General class license would become the entry-level HF ticket under the FCC's
proposed rules, applicants would have to pass at least the 13 WPM code test.

The FCC did not propose to change any operating frequencies or license
privileges for amateurs. However, the FCC does seeks comment on the
disposition of the current Novice HF bands, which carry a 200-W output
power limit for all licensees. The FCC invited comment on whether it
would be "appropriate" to delete the Novice bands and the power restrictions
on higher-class licensees and permit Novices to operate CW anywhere on 80,
40, 15, and 10 meters at 200 W output.

The FCC opened the door to comments on all aspects of Morse code testing from the amateur community. In particular, the Commission said it wants to know if hams prefer the current three-level system or would like to see it reduced to a one or two-tier system--and, if so, at what required speeds. The FCC asked whether hams would be willing to trade a reduction in Morse code requirements for additional written elements on newer digital technologies "which, in part, are replacing the Morse code." And, the Commission asked whether it should consider specifying Morse code examination methods, such as fill-in-the-blank or one minute of solid copy, instead of allowing VEs to determine the testing method.

In a related issue, the FCC also seeks comments on how to deal with potential abuses of the current disability waiver for higher-speed Morse code tests. In RM-9196, the ARRL had asked the FCC to require anyone applying for an exemption pursuant to a doctor's certification to first attempt the higher-speed test before examination credit could be given. The League also asked that VECs have access to relevant medical information from the certifying physician. The FCC said the ARRL's proposal would place "an unfair burden on examinees" and raised serious privacy and confidentiality issues.

The FCC went along with an ARRL petition and proposed allowing Advanced class hams to be eligible to prepare and administer license examinations up through General class under the VE program. The Commission said the change would permit greater testing opportunities for hams. The FCC also invited comments on whether it should change written examination requirements "to provide VEs and VECs additional flexibility in determining the specific contents of written examinations."

Referring to yet another ARRL petition, RM-9150, the FCC invited comments on how it can improve its Amateur Radio enforcement processes. The FCC applauded the ARRL "for its creative thinking" in that petition, but said the specific proposal was "inconsistent" with the current statutory role of administrative law judges. The FCC raised the possibility of encouraging complainants to include a draft order "to show cause to initiate a revocation or cease and desist hearing proceeding." The FCC said it also wants to hear how it can better use the services of the Amateur Auxiliary in beefing up enforcement.

The FCC proposed to phase out Radio Amateur Civil Emergency Service, or RACES, stations by not renewing their licenses. No new RACES licenses have been issued since 1980, and only 249 valid licenses remain. The FCC said RACES stations no longer are needed because any amateur station that has been properly registered with a civil defense organization has the same privileges as a RACES station.

The FCC also took the occasion to clarify the definition of "power" as used in the RF exposure table in Section 97.13(c)(1). The FCC said it refers to peak envelope power (PEP) input to the antenna. It also made clear that no one holding an FCC-issued ham ticket may apply for a reciprocal permit for alien amateur license.

The FCC set a longer-than-normal comment period. The deadline for comments
is December 1, 1998. The deadline for reply comments is January 15, 1999.
The FCC will accept electronic comments via the Internet at:

http://www.fcc.gov/e-file/ecfs.html

A copy of the complete NPRM has been posted on the ARRLWeb page:

http://www.arrl.org

The FCC NPRM can also be downloaded from the FCC Web site in Word Perfect 5.1
and Text versions as:

http://www.fcc.gov/Bureaus/Wireless/Notices/1998/fcc98183.wp
http://www.fcc.gov/Bureaus/Wireless/Notices/1998/fcc98183.txt

respectively.

* NASA FIRE DAMAGES SPACECRAFT PARTS *
====================================
An Associated Press report indicates that parts of two spacecraft, including
panels that are to be installed in the Hubble Space Telescope, were damaged
in a fire at the Goddard Space Flight Center, officials said last Friday.
Phillip Z.Tapper, emergency coordinator for the NASA center, said heat
protection panels for the telescope and for another spacecraft were exposed
to smoke and water last Thursday afternoon when a fire in an adjacent
structure spread into a laboratory building where the panels were being
processed. Tapper said the exact damage to the spacecraft panels has not
been determined, "but we don't expect there will be any mission impact."

Sergio Gorgone, LW7DXF, reports that AMSAT-Argentina now has a Web site.
The Web site may be found at the following URL:

http://members.xoom.com/Amsat_LU/

* KITSAT-OSCAR-23 NEWS *
==========
Satellite users have reported that KO-23's downlink recently went silent.
Kyung-Hee Kim, HL0ENJ, a KITSAT satellite command station reports that
the transmitter "tripped" and went off the air on 1998-Aug-18. It was
returned to service after 1998-Aug-20. The reason for the "trip" is
not yet known, and HL0ENJ has asked that any stations who received KO-23
telemetry data between the 18th and 20th to please send that data to:
khkim@satrec.kaist.ac.kr

* NEW COMET DISCOVERED *
==========
The European Southern Observatory recently announced that a new comet was
discovered on 1998-Aug-10 by amateur astronomer Peter Williams of Heathcote
(near Sydney, Australia). Having received information about this, other
observers on that continent sighted the new object the following day.

Official announcement of this discovery was sent to all observatories by
the IAU Central Bureau for Astronomical Telegrams on IAU Circular no. 6986.
The comet, provisionally designated as C/1998 P1, is seen in the southern
constellation Circinus (The Compass) and the magnitude is estimated at about
9.5. This corresponds to about 25 times fainter than what can be seen with
the unaided eye. The comet is easily visible in small telescopes. The orbit
(and therefore the current distance) is not yet known.

The coma diameter is at least 6 arcmin and is almost spherical, with a
slight asymmetry on the tailside. A very thin and quite faint plasma-tail
points in the lower left direction (position angle = 1170 = "8 o'clock"),
which is most likely close to the radial direction opposite to the Sun
(but this can only be confirmed when a first orbit has been computed). The
visible plasma tail extends at least 6.5 arcmin (beyond the field of view)
and is produced by the emission of light from CO+ (carbon monoxide ions)
originating from sublimating ice of the cometary nucleus. The presence of
this tail indicates that the comet is probably less than 1.5 AU (about 225
million km) from the Sun.

Too bad YOU dont have the GUTS to post your real name and call..
I say: do away with the code......INCREASE the THEORY test!!!
Code is NO barrier....just look at HF.......
Increasing the technical quality in the exams WOULD be the way to go.
(ahh but could YOU pass it?)

Chris
You are looking too high!
CW is usually below 50.1000 !!! NOT up into the SSB portion..
try 50.1 and below...you WILL be surprised as to the amount of
6 CW there is...I once worked a guy in W2 land from TX on 6 using
a ICOM 551....with NO CW key...(the owner didnt have one..) I
WHISTLED into the mic (had a little chirp according to the other
station! & perfectly legal!! though I would not recommend it for
those with dry lips or poor whistling skills :)

REALLY????? You mean ALL those QSOs I had as a Novice in the early 70s
at 5wpm were NOT good enough??? BY WHOSE BOOK???? Take your attitude
and shove it......deeply please!

Chris
WB5ITT
(originally WN5ITT in 1973 at age 14; Advanced since 1974; can do
20+wpm CW..at one time 35wpm......big fricking deal! I say lower it
to 5 and increase the technical test of the hobby.....can YOU draw
a Colpitts oscillator? or build one with a tube????? WHEW! Boy, lets
get them back in the test!!!)

Is that intended to silence those that object. This is America
the last time I checked. One is both entitled to their opinion
AND entitled to participate in the process of changing those
requirements we don't want.

Before I begin, I take exception to the title of this thread. I know several current and former ARRL BOD members and have met several others. In general, they are reasonable people trying to represent the views of the ARRL *members* as best they can. If you disagree with them (as I have on occasion), they want to hear about it. They may not do what you (or I) want, other members will have other ideas, but lack of attention is not a problem.

If you're NOT an ARRL member, too bad. If you have a well reasoned and well supported argument, they may well listen to you anyway. I've seen this happen many times.

Chris et. al.

As it turns out, the only "logical reason" for a CW requirement is a treaty to which the US is bound. The treaty requires a demonstration of morse code proficiency for access to Amateur HF spectrum. Changing this will require working through the US State Dept (NOT the FCC) and is likely to require a decade or more to complete.

The result of this is that, like it or not, we SHALL have a Morse code requirement of access to HF for the forseeable future. The current issue is to determine what the US means by "proficency" and enshrine that as part of the US Amateur license test.

That being said, the current set of test criteria places far too much emphasis on CW. However important Morse code has been historicly, today there are better (faster and more reliable) methods for reliable HF communications. The amateur exams should emphasize these techniques (among others) far more than they do now.

The morse code requirement should not be a "pass or fail" criteria any more than any other aspect of Amateur radio. The code speed requirement for access to Amateur HF spectrum (*any* license class) should be 7wpm and should count for no more than 20% of the total test score (70% being the minimum passing mark). Given a written test that is more relevant to

modern Amateur operation, a technically savvy applicant will be able
to get a license based on technical knowledge without using the code.
Those who aren't as technically adept, but have other valuable qualities,
can still get a license by concentrating on a somewhat different mix of
the skills and knowledge needed to operate an Amateur station.

Why 7 wpm? Several posters have suggested that the optimum speed for
very weak signal work, EME for example, is something like 5 wpm. My own
experience with EME (5 contacts) suggests that a somewhat faster speed is
closer to optimum (5 wpm is GLACIAL!!!). The ideal speed is somewhere
between 7 and 10 wpm, so I chose the bottom of this range. If the optimum
weak signal speed IS 5wpm, 7wpm will ensure compitance at the slower
speed. Also, I can just about write the dits & dahs down and translate at my
leisure at 5 wpm, but not at 7 wpm. The faster speed will ensure that the
code is really being interpreted and not being taken through an additional
translation step - in accordence with my idea of what constitutes minimal
"proficiency."

I'll agree with Glenn's proposal and thoughts, 7 wpm sounds fair to me. I'm willing to compromise.

Try this site:

http://www.amsat.org/amsat/sarex/shutfreq.html

Mir uses 145.985 FM for amateur packet radio mainly. They use 143.625 at times
to talk to the ground controllers. But you better speak Russian!

Hmm, then I suppose those weak signal and EME types aren't really
communicating when they use Morse at the speed where it can be
decoded by ear at the lowest SNR.

Hi Bill,

This dweeb claims to be a cop thus having the moral imperitive to tell
others what to do. Note the lack of callsign I don't thik this guy is
even a HF licensed ham perhaps not even a real cop, most likely a fat
security guard in a dead end minimum wage job.

The internet is a place that for $20 a month you can be as much of a jachass as you want, this guy is getting full value for his money.

If you're looking for a challenge, instead of beeping at CO, why not swim the
Florida Straight and deliver your message in person. Hell, there will
probably be a band playing and Fidel will offer you a big fat cigar. Should
be lotsa fun. Let us know how it turns out.

Well, that really depends on aspect of the hobby you enjoy most, doesn't it? I derive the most enjoyment from *communications* per se, not necessarilly the mode I use to accomplish it. Why would I bother to read these newsgroups, if not for the *communications* aspect of it!

While others enjoy other aspects of ham radio with PACTOR, RTTY, satellite, etc., I haven't developed any interest in it. Frankly, I am *glad* that there are so many different modes of operation available... otherwise, the pileups on 20m would be even worse than they are now (at times). There is a "challenge" built into every mode of operation, if one is paying enough attention to notice them for what they are.

I also enjoy "homebrewing" antennas, should I "put down" the ham who purchases "ready-made" antennas? I think not... Likewise, while code is a mode which _is_ available to me, I long ago lost interest in it and moved on to other aspects of the hobby which proved to be more satisfying *to me*...

As far as I'm concerned, those who *enjoy* CW should be rewarded for their diligence and preseverance! By all means, make CW an "endorsement" to a ham ticket, a "higher privelege" which must be earned. However, it isn't the "be all and end all" of amateur radio.

The truth hurts, don't it and I feel your pain.

If you no-code losers would be willing to pull your head out of your ass long enough to find your straight key, you wouldn't have a problem with the code. Now, you whiners even got the ARRL screwed up! I knew the no-code tech license would be the destruction of amateur radio, you guys took over the ARRL.

Save CW!!!!!

Are you "My Favourite Martian" with a antenna on each corner of your head? If not, then you have to use a radio receiver, just like everyone else. In case you haven't noticed, they are "electrical equipment".

Of course, you could be one of those people who think the CIA is beaming "voices" (or in your case, Morse) directly into their heads. ;-]

Hello !

I look for dates of ARRL EME 1998.
At http://www.arrl.org, they say that this information is avalaible in
QST... but I havn't got it.
Please, can you help me ?

73's. Eric / F5MSL

Some of those at Eurosom 2 were Amsat members. I'm trying to match up pictures. If you were in Ghent, please let me know.

Glen and Tom's responses where very informative, very UNLIKE your drool you no-name whimp. Glen outlined very well why SPEED CW should NOT be a large requirement or even a consideration. I guess the ARRL is dead on, they are not asking for CW to be removed, just the requirement for CW to be put into proper perspective. (i.e. its importance lessened) I can live with that.

Now stop cross posting into the Satellite group please.

Hi Chris,

I have been down there, LOTS of whistlers, but not you if you know what I
mean....:-)

Seriously, what is the CW calling frequency? I thought it was 50.1 but no
one is there.

John,

Three of us in the Dallas area sent cards to both the Russian address
and the college on Reunion Island. We all received an attractive
certificate from the college, but, alas, nothing from Russia, as yet.
I've made certain I have envelopes with the Incoming QSL Bureau just in
case the QSLs come in via that route.

Umm. To copy code off the radio, you need a radio too.

>Now, If other digital modes are
>to replace CW, then I propose that all prospective hams need to own a
>computer and buy a $300 dollar multi-mode TNC before their license can be
>issued. I've never met anyone who could copy RTTY or packet in their head.

Dinosaur thinking. Digital modes are not expensive. Computer equipment
appears all the time on the surplus market and in dumpsters. $300 TNCs are
a symptom of the stagnation in digital modes, but luckily are not required.
A decent sound card and the right software and you are good to go.

Better yet, let's start using chips which are available to amateurs and build
integrated digital radios. Lots of experimentation has been done with DSP
backends to the KK7B R2/T2 radios, lots more could be done.

>If you had to build a transmitter due to an emergency situation, a CW
>transmitter is easiest to build, and can permit worldwide communications even
>in the toughest band conditions. Try that with your pactor.

If you were in an emergency, you would not be building transcievers. If you
had to build one, you'd be dead or someone else would be.

>When CW is eliminated, then CB will increase by nine "new" bands and you'll
>hear "echo boxes" & "roger beeps" on your $1,000 rig as you attempt to work
>your best friend on pactor, and you shut off your rig in frustration.

Big deal. Cope with idiots, everyone else has to.

If "communication" is what amateur radio is all about, I'd say that was
pretty exciting.

Message-ID: <andrews-2508981750170001@haines-du-01-11.seaknet-dom.alaska.edu>
Source record: 15418

Hello,

I'm looking for a means of converting my old TV Dish into a Radio
Telescope. I know it's possible, but I don't know where to begin. Can
anyone point me in the right direction?

I'm not sure of the make of the Dish at the moment, though it's probably
about 8-12 feet across. The receiver/Decoder is a Zenith ZS-2PS.

Please send me a copy of your reply via email as my news server is very unreliable.

What I see as possibly the biggest hurdle to this kind of development (which I find interesting too) is one of perception, the increasingly widespread notion that only professional electronics folks can do worthwhile electronic design; that only aerospace professionals can do anything original with satellites (since this thread keeps getting cross-posted to rec.radio.amateur.space...). And so on.

A complete and utter crock, of course. But ham radio sometimes seems to be more a hobby of mythology than of technology...

Ken's remarks were so good they need to be reposted.

SAVE CW = SAVE HAM RADIO!!!!

In article <6rl7gg$o5m@news-central.tiac.net>, ken_freeland@yahoo.com (Ken Freeland) wrote:

The honest thruth is that the ARRL board members who voted for the proposal put forth
by the ARRL are totally clueless. We need to find out who they are and have them
removed from the board and preferably from Amateur Radio altogether. They're an
embarrassment to the League and to the ARS in general. Noone knowlegable about Amateur
Radio would dare put their name on such a proposal. They couldn't, with clear
conscience, vote for such a proposal. It's clear that those that voted for it are
shills for the equipment manufacturers. All they care about is numbers. They simply
want to sell more radios.

Rather than making themselves look like a bunch of horses asses, like the board
members of the League did, the fcc put forth a much more reasonable proposal.
Unfortunately their proposal creates problems and doesn't really solve any, it's just
less offensive than the Leagues proposal.

If you want to make any changes to the license classes, the whole structure needs to
be rethought out. You can't just drop a couple of classes.

Bascially what needs to happen is the Novice license should stay but it needs to be a
better entry level license. The full tech and codeless tech are an embarrassment and
serve no useful purpose and should be eliminated.

The novice license should offer hf/vhf/uhf privileges. For those that want the hf
privs they can take the cw test, for those that just want some vhf/uhf privs, they
don't have to take the code.

5wpm is too slow to be enjoyable to operate. Therefore the novice code test should be
at least 15wpm. 20wpm isn't unreasonable. The theory test should be several hundred
questions and cover all modes that the licensee is authorized to use.

HF spectrum shoul be as follows...

1950 - 2000 khz ssb/cw 200w
3950 - 4000 khz ssb 200w
3600 - 3615 khz cw 200w
10.14 - 10.15 mhz cw 200w
28.8 - 28.9 mhz ssb 200w
28.1 - 28.150 mhz cw 200w

vhf spectrum should be .....

50 - 54 all modes 25 w

222 - 225 all modes 25w

902 - 928 all modes 25w

The novice and code free novice would take the place of the current novice, tech, and
tech plus licenses.

We can let the current lazy bastards (techs, tech-minuses), keep their current privs
because I can't stand to listen to them cry if they're taken away.

General class cw should be minimum 20wpm.

Extra should go up to 30wpm.

Theory tests should be strengthened as well.

Remember there is nothing to be gained by lowering standards, you want to get better,
not slide back.

1888. Windtrax Balloon Flight

Newsgroup: rec.radio.amateur.space
Date: 1998-08-27 00:00:00 UTC
From: k9opo@netusa1.ns.net
Message-ID: <6s2pab$31b$1@news.netusa1.net>
Source record: 15428
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.misc

The Windtrax-21 balloon flight is scheduled to be launched Saturday, August 29, from Eastern Elementary School in Greentown, Indiana. Projected launch time is 7:00 AM EST (1200 UTC). Launch point coordinates are 40-28-32 N/ 85-58-04 W.

Packages and frequencies:

ATV - color camera horizontal view, B/W up view, 439.25mhz, vertical polarization, 1.5 watts peak power.

GPS - APRS format position and telemetry, 446.0 mhz, 750 mw, vertical polarization, 1200 baud AFSK.

Cross-band repeater - 144.3 mhz uplink, 444.850 mhz and 52.525 mhz downlink, all vertical polarization

SSTV will be transmitted on the 439.25 mhz ATV video carrier with 5 KHZ FM deviation.

There will be an HF net on 3857 +/- 10 khz. Listen for W9GO or WB9KWS.

Students will be operating on the cross-band repeater and HF nets, taking check-ins and relaying balloon position reports. All amateurs are invited to check in and chat with the students.

> run cw through the bird on the very top end of there sub band.
> AA7QA(note: extra callsign and qrm source) Mike

to which I've gotta reply:

Uh... the RS-12 KT uplink is from 21.210-21.250, Mike, so Novices and
Tech+'s are outta luck altogether on RS-12 right now. That was the
point of what John was saying.

But, you're right.. there is the chance that Extras in the 21.210-21.225
and Extras and Advanceds in the 21.225-21.250 segments of the band could
inadvertantly be causing some QRM on the satellite. From my experience
it's not all that much QRM, but it seems to have been some.

Hello

According to the SEDS web page,
www.seds.org/sedsat/
SEDSAT is scheduled to launch Oct. 15.

If you are referring to AO-27, I have had little or no
success working anyone via it due to it being swamped.
On top of that, even with my directional antenna and preamp it is still
barely audible.

I agree that all-mode equipment for 2m and particularly 70cm is
not cheap. Once I caught the satellite bug it took me a couple
of years to acquire used all-mode gear at a reasonable price.
I was then immediately able to work FO-20 with 10 watts and beam
antennae. Now we have both FO-20 and FO-29 operating in analog
mode continuously. They are relatively easy to work, if you have
the equipment. I managed to get a few dits through AO-10, but 10 watts
and my homebrew 70cm antenna just didn't cut it so I did have
to shop for a 100w amp. With this combination, I have worked
Belgium and New Zealand as well as many North American stations.

On the other hand, RS-12 mode KT was the very first sat I worked,
KT mode is largely responsible for my upgrading from Tech Minus
to Advanced. This way I could work satellite with 1 HF rig,
no directional antennae or expensive 70cm all mode gear. Since
the frequencies are much lower than 2m, doppler is negligable,
there is no guesswork or tuning around listening for your
downlink. You just pick where you want to be and call, or if
you hear someone else, you can calculate very quickly (a simple
subtraction in your head) where to call to land right on them.
These factors make RS-12 mode KT by far the easiest and cheapest
satellite to work --in my opinion. After reading these posts
yesterday I listened for it, sadly it was almost inaudible.

Has my HF gone deaf or is this the case for others?
Thanks
Erik

Consider trying FO20 or FO29. They are mode JA (145 up/ 435 down), the
same transmit uplink as mode KA was, and can be worked without
high-gain antennas.

I sent the following comments to the FCC at <ecfs@fcc.gov>, 'name removed'
because you code haters want to destroy ham radio.

73

<PROCEEDING> 98-143
<DATE> 08/24/98
<NAME> ** name was here **
<DOCUMENT-TYPE> CO
<CONFIDENTIAL> N
<DESCRIPTION> Amateur Radio Restructuring
<NOTIFY> ** e-mail was here **
<TEXT>I am a member of the ARRL and an ARRL accredited volunteer
examiner. However, I am not in favor of nor do I support the
proposal that was submitted by the ARRL to theFCC on the restructuring
of the Amateur Radio service. I do support the restructuring of
the Amateur Radio Service as proposed by the FCC (WT Docket No. 98-143)
and would like to offer the following requested comments:

The Novice class license should be phased out as the Technician
class license has become the entry level license to the service. Former
Novice class HF spectrum should be reclassified for use by General,
Advanced, and Extra class licenses, or remain "as-is" for use by Technician
class licenses(If it is decided that Technician class licensees should have
HF privileges). Power levels for grandfathered Novice and Technician plus
licensees should remain at 200 watts in their sub-bands. The new Technician
license should have the same privileges and examination requirements as the
old Technician plus class licenses. The new Technician license would require
passing Element 1A five WPM morse code exam.

Privatization of Enforcement procedures: I am not sure if enforcement
procedures can be privatized, however, one solution to correcting violations
in the Amateur Radio service would be to try and prevent them from occuring
in the first place. This could be accomplished by requiring candidates pass
a more rigorous Amateur Radio exam. Making an Amateur Radio license harder
to earn, better individuals will hold licenses. If licenses become easier to
obtain, more candidates will be licensed and rules violations and enforcement
problems could increase. Remember, the goal of restructuring is to relieve
some of the burdens the FCC has with the service.

Telegraphy Examination Requirements: I support keeping the telegraphy
requirements unchanged. Element 1A for Technician, Element 1B for General
and Advanced, Element 1C for Extra class. Unfortunately, there are as many
valid reasons for keeping Amateur Radio telegraphy requirements as there are
valid reasons for phasing them out. The telegraphy requirement is a stop-gap

to the Amateur Radio Service and does make a license more difficult to obtain, but when an individual has to work harder for something they tend to appreciate that something a little more and won't abuse it once it has been attained. An Amateur Radio telegraphy requirement can ensure better practices on the ham bands because individuals appreciate the rewards of their hard work.

Examinations: (More comments) A passing score on written examinations should be increased from 70% to 90%. This would increase the difficulty of the exams without requiring the creation of new exams or questions. Another change which would improve the service, would be to require Radio Amateurs seeking license renewal to retest and pass all exam elements required for their license class. This would mean licensed amateurs must stay familier with current service regulations and subject matter.

If you agree send your own comments to the FCC.

ounds great to me,unfortunatly the ARRL(I am a member)is a big
influencial force and I believe they will push for thier proposal
regardless of what the membership wants.They seem to have the same
disease our government has,at least the symptoms are the same. 73 AB7RS

Yep, a cool site indeed, and you can get those latest WWV reports and much
more with ABW++, available from URL below.

If you are referring to AO-27, I have had little or no
success working anyone via it due to it being swamped.
On top of that, even with my directional antenna and preamp it is still
barely audible.

You're right, it's often a mob scene on weekends, especially on the trans-
continental passes. I suspect it requires a different set of skills to work
effectively than most of the other birds. It's easier to hear outside of
urbanized areas, by the way.

After working AO-27 for about a year, i got an Alinco DJ-G5TH and have been
able to hear it (and work it) with a long rubber duck. But i cheat a little,
given i always use a chain link fence or other large vertical metal object
as a reflector, and folks on there already know me. That mode of operation
is NOT for beginners!

antennae. Now we have both FO-20 and FO-29 operating in analog
mode continuously. They are relatively easy to work, if you have
the equipment. I managed to get a few dits through AO-10, but 10 watts

I'll have to see if i can hear them with my homebrew 2m/70cm antenna, which
let me work AO-27 comfortably with an HT (i've been primarily operating
satellite mobile so far). I was able to copy K6AKO (SSB) last night with
the DJ-G5T (in AM mode), so that's a decent nudge for me to get ready for
SEDSAT.

I agree that all-mode equipment for 2m and particularly 70cm is
not cheap. Once I caught the satellite bug it took me a couple
of years to acquire used all-mode gear at a reasonable price.

...

Erik van Bronkhorst
kc6uut@qsl.net

I've got 6m QRP SSB, so maybe an asymmetric transverter (10M -> 6M -> 2M)
might do it for me. Has anyone tried such an approach? Given separate
feedlines (not unreasonable at 10m), that has the nice property of not
requiring antenna switching (and with a suitable antenna, i may be able
to do without an elevator). Hmmmm, if the LO for the converters were
varistor VXOs, i could probably use a pair of DACs and a laptop/palmtop
to supply doppler compensation...

Consider trying FO20 or FO29. They are mode JA (145 up/ 435 down), the
same transmit uplink as mode KA was, and can be worked without
high-gain antennas.

Rick Tannehill - W7RT

Later i can think about a downconverter from 70cm, after i have developed some RF construction skills... I'll see what i can hear next time they come over when i have my LPVA with me (as it resides in my office on weekdays).

But meanwhile, AO-27 keeps me pretty busy. But it would be nice to able do something vaguely resembling a decently long QSO, as anything vaguely close to ragchewing is out of the question on AO-27 (except on rather rare occasions, like a weekday Pacific pass when Hawaii hasn't been heard for awhile).

I find this message quite curious and a bit amusing. Although I didn't agree with it, I thought the sumbission was quite bland. I can't get the connection between removing his(?) name and "you code haters want to destroy ham radio."

Everyone should make submissions about Amateur Radio when requested. Whether anyone else agrees with your point of view is irrelevant.

I think this person had better start taking his anti-paranoia pills again.

The only valid reason for code exams is to satisfy treaty obligations.
Unless you want to create CW only sub-bands for those who pass higher
speed code exams [I would be willing to support that].

>
> Examinations: (More comments) A passing score on written examinations

Is he serious??? 90%.
When I was an army officer the passing level was 70% for my advanced
course!!! Try explaining to a judge that Army officers only need to
pass 70% but HAM RADIO OPERATORS [for a hobby] MUST pass at 90%. I
surmise the judge would laugh you out of court.

I regret that this unknown person so fears Technicians that he wishes to give away his frequency allotments. In my opinion, the VHF & UHF bands and above are where the challenges will be in the future. The goals of the amateur radio community should be to bring in more members, not fewer. I wonder if the posting person would be on this medium if he was required to know how to program in Basic or Cobal before he could participate. His requirement to know CW is the same as if we on the internet decide that he must be proficient at JAVA before he can use the internet. Actually, that is not a bad idea. It would mean that there would be a lot fewer on here so access would be a lot better, we would probally have a much more intellegent (defined as computer literate) gathering of the minds.
The way to keep amateur radio from going the way of CB at its' worst is not to carry on an antiquated communication mode as a "rite of passage" barrier to membership in some immature fraternity. I support entrance examinations which include a more rigorous skills level in the theory of the electromagnetic communications spectrum uses. they should include a lot more in the areas of digital communications, satellite based methods, spread spectrum applications, and the world of microwaves. I am a no-code Technician class operator and do not intend to waste my limited spare time on learning CW, I have many, many more interesting subjects to master in the realm of electronic communications. The value gained for time invested is the lowest possible returned when CW is the subject of study. If I wish to comminicate in an antiquated mode, I can set my TNC to resend from my keyboard in CW mode. It will receive CW and translate to print. My, MY. the miracles of modern gadgets.

My final comments are directed to the cry that CW might be the only means of communication available in the time of major catastrophy. There are a few examples in past history when that was true. Today, however, we live in a much more connected world. Satellite communication has made the entire earth accessable with no more than a hand held transmitter. The Inmarsat and like systems now comming on line will make the entire world available with a simple telephone, eventually costing only a fraction of the price of an HF transciever equipped with a 1500 watt amplifier and the massive antenna system. The satphone is not subject to propagation fadeouts. Redundancy insures dependability. All of this tells me that the likelyhood of using HF from amateur radio operators as a last ditch means of worldwide communications is highly improbable. Should there be a occasional S.O.S sent, it will probably be sent be an automatic emergency system via satellite as was recently used on the downed ballon which attempted the around the world flight. It worked.

I wish that you didn't feel so threatened by the newcommers to your hobbie. Have a good life.

My understanding is that the Russian postal system is full of thiefs. I'm
real glad Mir got a U.S. card manager (Thanks Dave), or else very few would
ever get cards back.

To draw a comparison Tony, I am sure you do not have a mandated testing for
a Ford TriMotor to move on from a E6 to a F18 or vise versa.

Could be why the military dropped code as well? Along with the BCAG(?)...

Well, many of us don't use amateur radio any more because
we are HERE. As numbers of users drop, other services will
move in to take over the frequencies. We are a dying hobby.

Source record: 15365

Hellos,

I possess a radiot�l�phone ALCATEL ATR 2680.

I would want to modify it in order that i could use it on Ham frequencies (430 / 440 Mhz).

I'm therefore to the research of the software, and the interface of programming.

If you have that at will have, you will be very nice toprovide me it in E Mail.

Thank you to read me.

Cordially, Olivier F4AFO.

1925. Used O-Scopes in Toronto??

Newsgroup: rec.radio.amateur.space

I am interested in obtaining a cheap O-scope and everybody tells me to go to a hamfest, OK where is one!?? Anyways, any fellow Torontonians out there know where I can find a cheap used o-scope? Looking to spend around $150, it doesn't need anything special, single trace, dual trace, 1950 vintage whatever, where can I find one? Thanks in advance for any info. TTYL

Pretty scary that we have C- Army officers and aircraft inspectors.
I suppose that with today's education system it would be unrealistic
to set 80% as a passing score.
Jeff KH2PZ

P.S. What does "Get real people" mean? Have we been collecting phoney
people? (See what happens when you set 70% as passing for aircraft
inspectors?)

1930. FTV - WEFAX,FAX,SSTV,RTTY,CW for SoundBlaster

Newsgroup: rec.radio.amateur.space
Date: 1998-08-30 00:00:00 UTC
From: "Brian E. Cauchi" <_briane_@geocities.com>
Message-ID: <35e9c74b.0@195.158.64.19>
Source record: 15371
Cross-posted to: alt.ham-radio.fax,rec.radio.amateur.digital,rec.radio.amateur.digital.misc,rec.radio.amateur.misc,rec.radio.amateur.space,rec.radio.shortwave

FTV can be used to receive images from Weather Satellites and Terrestrial Facsimile Stations, text transmissions from radio telex services, Morse code, as well as Amateur Radio FAX, SSTV, RTTY and CW signals. It can also transmit Amateur Radio FAX and SSTV. No external hardware, other than a radio, is required, as all the necessary signal processing is implemented in software.

FTV is now in Version 1.0k

Main features

WEFAX, FAX, SSTV, colour SSTV, RTTY and CW reception.
Transmits 8 FAX (2 in colour) and 18 SSTV (10 in colour) modes.
FAX operation supports APT signal recognition and scheduled reception.
No external decoder or converter box is required.
Signal analysis is provided on all modes.
Many parameters are adjustable while receiving.
Recovery from wrong mode settings is possible.
Program works in real time (about 1 second DSP' time lag)
Images may be loaded and prepared for transmission while receiving another.

Minimum system requirements

80386 CPU
Sound Blaster compatible sound card
256K of extended memory (preferably 4096k or more)
SuperVGA graphics card with VESA support (at least 640x480, 256 colours)

Check out my site on http://www.geocities.com/SiliconValley/2504 for information on FTV - Wefax,Fax,Sstv,Rtty,Cw software for the Sound Blaster.

Brian, 9H1JS.

1931. Re: RS-12 Back in Mode KT

Newsgroup: rec.radio.amateur.space

Message-ID: <6sbuf8$67n$1@wall.tli.de>
Source record: 15372

Hello fellow hams !

I was a bit confused about the change of mode at RS-12
but it happens from time to time (confusion and change of
mode :)). Well, at my place signals on 2 m are often louder
than on 10 m so I appreciate the change. But the fellows
who have the german class 2-licence are out of the boat,
they are not allowed to transmit on shortwave, i.e. 15 m-band.
That is the disgrateful thing about it.

Hope there will be fun on Sedsat !!!!!!!!!!!

By the way, join my homepage www.qsl.net/dl1ah/ with only
one little picture on it.

I like that, and wish I would have thought of it. Increase passing grade test scores on written tests from 70 to 90 percent. I think it's needed. Nothing pisses me off more than when I hear a couple of no code techs QRM'ing satellite operations because they're too stupid to realize they're transmitting FM in a satellite passband. If they studied harder they would be aware of these things. Current code requirements on upper class licenses are good because people generaly spend more time studying before they try and pass the test.

ARRL proposal is DOOM & Gloom for ham radio and the ARRL Idiot board members don't speak for me either.

The judge may get a laugh but in my experience any commander forced to take an officer passing at 70% would definatly be frowning. The idea was to max it, not min it.

Did you want to work on My airplane? Maybe that is the difference here. Many don't wish to operate OOK but are forced to learn Morse anyway. You were tested because lives did depend on you knowing your job. You also got paid for both learning and working. No one here gets paid for beeping nor learning to do so. Look again and you may actually see the problem and it has nothing to do with your chair.

Well, when I was a no code tech working satellites I found several hams
with extra
class calls using FM simplex to talk to the car behide them on the freeway.
They were
on high power and on 145.850 (AO-27 uplink). They did not take kindly to be
told
they were going to be uplinking to a satellite if they kept it up for
another few minutes.

At least the no code techs I found doing it where glad to be told about it
and wanted to
know more about how they could work the birds.

Then there is that person on FO-20 and FO-29 that runs CW at very high power
and will
not reduce it when he has been told he is running too much. I have nothing
against CW
but I hate it when all the voice QSO's are being modulated by his CW!

Well Mr. Photon phallic symbol,

I honestly do not know what studying code has to do with studying tech, but why not post it on the proper newsgroup. As for QRM'ing SatOps, which one? AO10, FO20, FO29, RS15? Can't be RS12, its back to mode KT, so you are hearing those high speed extra ticket folks walking on you.

Meanwhile, take your own advice and study.

The schools [military] set the standards for graduation, not the field commanders [they take who they get sent]. I think my score was about 83%. In my case it was a self-paced course of study for the Advanced Course. You got a module to study then take an exam and then get another module. It was the first class to do so and the ones in charge of the program did not have a clue on how to run such a program. If a student exelled and finished early ...know what their rewards was ??? They got assigned to a temporary duty assignment on post to work an 8 hour day. That word got arround real fast. So the idea was to not finish early. there was no schedule saying when each module had to be completed. So I [my graduate education was in education training & development] would pick up a module, then take my time with it. I would go in and take about 3-5 exams on a single day and pass them then get some more modules to study. Oh by the way it was 'open book' too. I think I did all my modules in the last three weeks of the course ... that way I had more free time to devote to other pasttimes.

After I went through the course and had a 83% score [mid level standing with my classmates] they changed the rules for the next class and made them do so many modules on a schedule.

Hello Mr Pedo.

I am a little curious as to how you determined the class of license held
by those who "pissed you off". Maybe you were so driven you copied down
the calls and checked the database. Maybe so. Was there a method by
which you could have just let them know they were screwing up your
efforts. In the good ol days, one of the real 1X2 guys would tell you
in a hurry when you stepped on somebodys toes.

Current code requirements on upper class licenses are
> good because people generaly spend more time studying before they try and pass
> the test.

And getting real good at Morse would have been all we needed to prevent
the offenders from doing so? I would like that explained a tad better
if you wish it to be believed.

>
> ARRL proposal is DOOM & Gloom for ham radio and the ARRL Idiot board members
> don't speak for me either.

I have problems believing you would acknowlege anyone speaking for you
unless they totaly agreed to every thing you happen to like. Who do you
suppose in todays world that would be?

Good luck but you are in a very narrow corridor and support of your
concerns will be spasmodic and short lived at best. Too bad we can.t
all think alike isn't it?

If you feel that way, e-mail your comments to the FCC. The more people that
speak against the ARRL, the better our chances of saving CW and maintaining
the current standards and our amateur radio bands won't end up like 11 meters.

ARRL Betrayed us!!! SAVE CW!

1948. Satellite and VHF/UHF radio selection

Newsgroup: rec.radio.amateur.space
Date: 1998-09-02 00:00:00 UTC
From: dinoal7lz@aol.com
Message-ID: <1998090220360900.QAA20048@ladder01.news.aol.com>
Source record: 15293

I'm considering buying a new V/UHF radio to work both satellites and terrestrial SSB/CW weak signal stuff. Have time to wait as the market plays out with the big three introducing new radios with HF/V/UHF capabilities, but really don't need another HF radio [unless I want to work HF satcoms too...]. The most "appealing" rig is the Yaesu FT-736 'cause I can get 6/2/220/450 and 1296, albeit only four at a time, and not have to go the transverter route to be capable on all these bands that I want to work. But the 736 is "old" even though it's still being sold new. Kenwood TS-790 is another choice, but after reading QST's review and talking to some folks that probably rates low on the scale. Obvious others are the FT-847 and IC-821. If the 821 had modules for 6/220/1296 I'd probably buy it in a heartbeat. So am looking for thoughts and suggestions---I doubt anyone is gonna build another comparable 736 but maybe somebody knows something I don't (almost a guarantee!). Thanks in advance for your assistance---replies welcome by e-mail or here on the newsgroup.

I agree that we shouldn't see all these .policy postings here, and we
need to make our feelings known to those doing the posting that they
don't belong here.

1950. RS-12 in mode KT

Newsgroup: rec.radio.amateur.space
Date: 1998-09-02 00:00:00 UTC
From: John Bosco <mvi@ix.netcom.com>
Message-ID: <6sm3pg$ceq@sjx-ixn2.ix.netcom.com>
Source record: 15295

I was very disappointed to hear that the 2m uplink on RS-12 has been switched off. This was the only mode A sat available (I don't count RS-15) and the only sat that I can work with my current station.

I have spent many hours enjoying this bird and have logged/confirmed more than 20 states in just a few months. If any others out there feel this way about wanting RS-12 changed back to mode KA, please let your voices be heard here.

Mode A allows anyone with a Tech license, a 2m all-mode rig and a shortwave radio to experience satellite communications. No fancy antennas or rotors are needed.

Maybe the powers that control RS-12 will read your posts and be kind and understanding enough to change RS-12 back to mode KA.

Respectfully,
John Bosco
KB2YJH

1951. Off Topic Postings

Newsgroup: rec.radio.amateur.space

Message-ID: <6si56v$71q@freenet-news.carleton.ca>
Source record: 15388

It seems that about half the traffic in this newsgroup consists of off-topic postings, most of which belong on rec.radio.amateur.policy. And most of those are multiple postings, many of them addressed to this ng, the .policy ng, and several others.

What is one to make of this? I presume that most readers of this ng find these cross-postings useful, as it saves everyone the trouble of reading rec.radio.amateur.policy.

Is my mind overly orderly in prefering to read space postings in .space, policy postings in .policy, antenna and realted discussions in .antenna, and so forth?

1952. SATELLITE SOFTWARE - HOW IT CAN HELP YOU!

Newsgroup: rec.radio.amateur.space
Date: 1998-09-02 00:00:00 UTC
From: emanuel.marques@NOSPAMmail.telepac.pt
Message-ID: <35ed2d06.6523483@news.telepac.pt>
Source record: 15389
Cross-posted to: rec.video.satellite.misc,rec.radio.amateur.space,rec.radio.amateur.misc,rec.radio.amateur.equipment

Many people don't know that the right software program can be of great help, even for the non professional dish installer (DIY). Others are reluctant to use satellite software because they think it's too complicated to use or even useless.

This is not a FAQ about satellite software, but an attempt on my part to try to better inform potential users about the benefices of using satellite software.

I. WHAT IS SATELLITE SOFTWARE?

II. ABOUT SKYSOFT SOFTWARE.

III. IS IT USEFUL FOR ME?
A) I AM A PROFESSIONAL DISH INSTALLER.
B) I AM NOT A PROFESSIONAL.

IV. SKYSOFT SOFTWARE AND OTHERS

I. WHAT IS SATELLITE SOFTWARE?

There are several types of "satellite television software". Some are dedicated to help professionals and DIY dish installers to setup satellite systems. Others are meant to emulate viewing cards used by encrypted channels. Another more recent type of software is meant to replace the original software of some satellite receivers in order to add new features.

II. ABOUT SKYSOFT SOFTWARE.
Skysoft is the name of my project dedicated to satellite software tools. I am only interested and dedicated to developing engineering software (dish aiming , downlink budget, etc.).
Currently I have three software programs available; EASYSAT, PCSAT, and ARQSAT.

You can find more information about Skysoft and the software at:
http://www.sat-net.com/skysoft/

III. IS IT USEFUL FOR ME?
A) I AM A PROFESSIONAL DISH INSTALLER.
The true professional plans receptions systems. It is hard to imagine someone doing all the required calculations one by one. Nor is it acceptable to use the trial an error method or go by the word of mouth to determine minimum dish size, for example.
A good software program can save you time and money!

B) I AM NOT A PROFESSIONAL.
If you are planning to buy a satellite system EASYSAT (just 25 USD!) can be a great help:
- Find what satellites you will be able to aim to.
- Find what satellites/channels you will be able to receive.
- Find the optimum dish size for your location and for the channels you want to receive.
- Help you better understand how satellite television reception works, and how individual components and parameters affect system performance.

If you already have a satellite dish system:
- Help you diagnose reception problems (satellite signal is too weak, dish is to small, deficient dish aiming, etc.)
- Help you decide on equipment upgrades (how much bigger the dish should be, will a lower noise Lnb "do it", etc.)
- Help you better understand how satellite television reception works, and how individual components and parameters affect system performance.

IV. SKYSOFT SOFTWARE AND OTHER SOFTWARE PROGRAMS.
There are other software programs that perform similar tasks, in what ways are EASYSAT and PCSAT different?

Being a long time user of satellite software myself, I have found that available satellite software falls into two categories:

1) Programs with many functions, but unfriendly and too technical for most users.

2) Programs easy to use, but with few features, "over simplified", and easily outdated. These are usually free programs sponsored by satellite equipment manufacturers and therefor are designed to work with only a particular brand of equipment (dishes).

Having practical knowledge of satellite systems design and installation. I have been integrating really useful functions and features to my software programs. Some of them are exclusive of my software, which makes them arguably the most user friendly and useful software for the typical professional and DIY installer.

For more details, please go to the Skysoft Web Site at http://www.sat-net.com/skysoft/

We use the IC821 at our University ground station. It has a nice solid feel to it. About a month ago we tested the FT847 for another university's groundstation. It has a lot of features with a built in pre-amp and Texas DSP processor for filtering. (The DSP filtering is impressive!) Personally I did not like the feel of operating the radio.

Don't know much about the other radios.

That was a Morse code exam. CW requires an RF transmitter and
receiver. Did they use an audio device to generate your
Morse code exam? If so, it was not CW.

A "Morse Code exam?" Probably from tapes generated by computer and recorded over a patch-cord. If I read Mr. Coyle's remark right, he's pointing out that it was not an exam based on an on-off keying of continuous-wave RF. That the majority of hams who work CW and enjoy it have conflated the terms "CW" and "Morse Code" should, of course, make the meaning of "CW exam" sufficiently obvious.

1970. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.space
Date: 1998-09-04 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6sntbe$3qv@news.Hawaii.Edu>
Source record: 15312
Cross-posted to: rec.radio.amateur.space,rec.radio.broadcasting,rec.radio.cb

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

1977. North Korean Satellite???

Newsgroup: rec.radio.amateur.space
Date: 1998-09-04 00:00:00 UTC
From: thomsona@netcom.com
Message-ID: <thomsonaEyrn72.8z1@netcom.com>
Source record: 15319

Has anyone heard this thing?

Pyongyang, September 4 (KCNA) -- The Korean Central News Agency Broadcast a report today over the successful launch of the first artificial satellite in the DPRK. The report says: Our scientists and technicians have succeeded in launching the first artificial satellite aboard a multi-stage rocket into orbit. The rocket was launched in the direction of 86 degrees at a launching station in Musudan-ri, Hwadae county, North Hamgyong Province at 12:07 August 31, Juche 87 (1998) and correctly put the satellite into orbit at 12 hours 11 minutes 53 seconds in four minutes 53 seconds. The rocket is of three stages. The first stage was separated from the rocket 95 seconds after the launch and fell on the open waters of the East Sea of Korea 253 km off the launching station, that is 40 degrees 51 minutes north latitude 139 degrees 40 minutes east longitude. The second stage opened the capsule in 144 seconds, separated itself from the rocket in 266 seconds and fell on the open waters of the pacific 1,646 km off from the launching station, that is 40 degrees 13 minutes north latitude 149 degrees 07 minutes east longitude. The third stage put the satellite into orbit 27 seconds after the separation of the second stage. The satellite is running along the oval orbit 218.82 km in the nearest distance from the earth and 6,978.2 km in the farthest distance. Its period is 165 minutes 6 seconds.
The satellite is equipped with necessary sounding instruments. It will contribute to promoting scientific research for peaceful use of outer space. It is also instrumental in confirming the calculation basis for the launch of practical satellites in the future. The satellite is now transmitting the melody of the immortal revolutionary hymns "Song of General Kim Il Sung" and "Song of General Kim Jong Il" and the morse signals "Juche Korea" in 27 mhz. The rocket and satellite which our scientists and technicians correctly put into orbit at one launch are a fruition of our wisdom and technology 100 percent. The successful launch of the first artificial satellite in the DPRK greatly encourages the Korean people in the efforts to build a powerful socialist state under the wise leadership of General Secretary Kim Jong Il.

Evidently you did miss it. You should have asked your FCC examiner what
the FCC thinks about CW and Morse. He would have probably directed you to
the definition in Part 97. Maybe you ought to take a glance at it Jeff.
I had hoped to settle the issue when I provided the reference last time
this discussion came up.

I would imagine no more than a handful of hams would be able to muster
that kind of power. They probably wouldn't do it for very long, either;
the operating costs would be prohibitive.

And what effect would they have on broadcasters with >10 dB more power
and as much as 20 dB more ERP?

From a different dictionary this time....

Pedant (Page: 1056)

1. A schoolmaster; a pedagogue. [Obs.] Dryden.
A pedant that keeps a school i'th' church. Shak.

2. One who puts on an air of learning; one who makes a vain display of
learning; a pretender to superior knowledge. Addison.

Sound is a transverse wave. CW is defined as an electromagnetic
wave mode.

Also, a steady pitch cannot contain any information and therefore
cannot be used for a Morse code test.

> Does anyone have any suggestions?

Noise bursts from the active sun can be received in the range from 20 to 400 MHz (approximately). I've heard these bursts on 21 and 28 MHz in previous solar cycles. Any good shortwave receiver and a dipole or other simple antenna should be adequate. A receiver with a good S-meter is very helpful.

Other possibilities are 50 and 144 MHz, where the antennas can be more directional. The equipment should be capable of receiving AM or SSB rather than FM.

A different type of solar emission occurs at microwave frequencies. It is a more steady emission, not as exciting as the noise burst activity at the lower frequencies. The level of this microwave emission varies slowly over time and is used as a general indicator of solar activity. Observing this emission will require a dish antenna and a microwave radiometer receiver.

Some other sources of information are:

Society of Amateur Radio Astronomers http://www.bambi.net/sara.html
EME/SETI/Radio Astronomy page http://www.nitehawk.com/rasmit/welcome1.html
Radio Sky Publishing http://radiosky.com

Hope this helps.

It's a pity you had to look the word up in a dictionary, Mark. I recall
encountering it on a grade-school spelling test.

In any technical field (e.g., amateur radio), definitions are of vital
importance. Slang and street-talk have no place and use of such label one
as not having any depth in the field.

Raw power means absolutely nothing unless you (roughly) spend the same bucks on the
antenna. Hams
normally don't even start to have the broadcasters investments in antennas.

Do you suppose they used one of the old Hy-Gain crystal boards that were so popular for CB to 10M conversions? On the open market, that should cost them about 40 bowls of rice from starving children's mouths. The crystal costs extra. Meanwhile, we send food over there to feed their soldiers, and are preparing to build them a "safe" nuclear powerplant (so they'll shut down their Chernobyl -style plant).

It's O.K. Mark,

These Rabid pro coders are technologically inept. They probably think "Not Me" is their real name....:-)

Just wish they would stop cross posting into a newsgroup where they are clueless as to what it is. To them a Satellite was a really good car.

Notice I used the term "Rabid pro coder". I know of Real Amatuers that use code, but don't ram it down your throat.

>Evidently you did miss it. You should have asked your FCC examiner what
>the FCC thinks about CW and Morse.

I didn't have to. When we, the examinees, were ushered into the testing room the government official explained that he would administer a five-minute Morse Code exam (no mention of "CW"); we were to provide at least one-minute of error-free copy; at the end of the five minutes he would say "stop" and we were to put down our pencils - anyone caught making cor-rections after that would fail the test. He went on to say that those who passed would then be asked to send one-minute of code (again, no mention of "CW"). At that point, I remember him glancing at my jacket and giving me a wink (I was wearing my USCG wind-breaker - later I learned he was an ex-Coastie himself). That one wink immediately melted all the stress I was feeling! I don't recall a thing about the written exam I took that day, but I do remember every detail of the *code* test.

During my five months of U.S. Coast Guard Radio School, we had daily *code* practice. I still have all my manuals and paperwork from that time; no mention of "CW" except as an operating mode.

>He would have probably directed you to the definition in Part 97.
>Maybe you ought to take a glance at it [sic] Jeff.

Like all good amateurs, I do have a copy, and I do more than just glance at it.

>I had hoped to settle the issue when I provided the reference last time
>this discussion came up.

I'll be waiting with baited-breath for your "reference."

According to the CNN website it is unlikely they actually orbitted
anything. USSPACECOM doesn't report any new objects in orbit and the
Japanese are hopping mad after the booster went over their territory.
When someone hears the thing or we get a verification from USSPACECOM
I'll believe it.

Sounds good! As you know, orbital store-and-forward technology is not
new. My only concerns are legal and political. Legal because I thought
that our VK brethern are severly restricted concerning third-party traffic
from a non-ham. You certainly know your local laws better than I do, but
won't you have a problem the first time internet spam gets relayed?

>We envisage prospective members of the remote ground network having

The political concern is that many countries are VERY paranoid about
potential competition with the national post office/telephone system.
Might some volunteer ground stations have a problem?

2014. RFC: Remote Satellite-Internet Gateway Opportunity

Newsgroup: rec.radio.amateur.space
Date: 1998-09-07 00:00:00 UTC
From: Joe Sleator <sleat@zip.com.au>
Message-ID: <35F31E3F.5AC7@zip.com.au>
Source record: 15256

Hello,

I am Systems Manager for a microsatellite project at The University of New South Wales, Australia. We plan to launch Australia's second ever amateur microsat from Woomera late next year.

We are researching ideas for experiments to fly on the satellite. I am looking for feedback on the feasibility of creating a ground network of packet radio stations which will communicate with our Low-Earth-Orbit microsatellite and relay communications to the internet via active gateway software which we are designing. The goal is to create a truly amateur and grass-roots satellite resource that is permanantly online and accessible to anyone via the net.

We envisage prospective members of the remote ground network having access to a permanent internet link, or at least a reliable, speedy connection when the satellite is overhead, and to at least a 9600 BPS TNC, and groundstation equipment. Interested people would be required from all parts of the globe, so that we may provide constant contact with the sat to the internet, via the volunteers.

I invite comments and questions on this proposal.

Regards,

Joe Sleator
Satellite Systems Manager,
BLUE-SAT Project

I'm selling a the Glen Martin Model RT-424 "4.5ft" roof top tower
that is made of rugged 6061-T6 Anodized angle aluminum with all
stainless steel hardware. No maintenance or painting is required.
Plus a Model: TB-25 Thrust Bearing for rotating setups, premium
quality, weatherized twin bearing for 1.3 to 2.6 mast diameters &
Mast MA-2069 106" X 2.375"OD .145 wall aluminum hvy duty
12 lbs. Used less than a month. Asking $270.. Sorry I can't ship
Tower, Thrust Bearing and Mast are assembled... Must pick up!
Serious offers only please. Qth Burlington, NJ 10miles South of
Trenton, NJ & 4miles North-East of Phila, Pa.
If interested please email or call: 609-386-9382 or If busy call:
609-386-3272 [Afternoon's Only!!] Tnx for reading my post..
Thomas j. N2RIF -73

All Glen Martin Pricing Dateed: 09/07/98
RT-424 New = $162.00
TB-25 New = $ 89.95
MA-2069 New = $108.00
Total: $359.95 + Shipping

Mark,

I tend to believe that that post was in fact a troll. However, you make a good point and I have to wonder, what level of CW proficiency is really considered acceptable by the code as the ONLY true way people? It looks like the 5 WPM people were "OK" as long as they stayed up with the no coders or stayed on 10 SSB and the narrow HF CW segments assigned to them.

Is 5 WPM not now acceptable because those who have passed it might have some greatly expanded HF privileges in the future? Does it really start at 13 WPM.... or even higher?

Someone at a recent hamfest that I attended stated that "Morse code is the most efficient means of communication possible" (right, Jerry?). I cannot believe the idiocy of this statement.

Pick up your cordless phone. If you purchased it in the last year it is probably operating with a digitally encoded spread spectrum mode. Seems to me that is damn efficient, given loads of these phones can operate at the same time, in the same narrow band of frequencies, with NO interference.

CW is fun, it can get thru QRM where SSB and other modes fail, but it is 100+ year old technology.

The same folks that are advocates of the code need to be advocates of 21st century modes as well.

You know what is great about morse code? It is the first digital means of radio communication. But if communication is your goal what's the difference between 1100, ..-- or 'A'. The only difference that I can see is the discipline used to send and copy morse code.

Why would this ham type out morse code that bashes an organization full of people that can read it and know how to spell "cry".

By the way if you do not know how to read code the following is what the morse code says.

"Tell the arrl to go to hell. save cw no code cky babies die"

I do not feel this way, I want the ARRL to fill the airwaves with new hams ones that will stand up and contribute to the hobby that they feel is valuable. I do not think the attitude this ham conveys, one that bashes the only organization willing and able to defend the threat to our bands, is valuable to amateur radio . This ham needs to read a bit more about the the little LEO's, the FCC mandate to make more spectrum available or the FTC's mission to grow the communication industry.

Moreover, If you are a new ham you are a real ham, your ticket says so!

CW is CW. If I hear a CQ at 5 WPM I am just as likely to answer it as if it is 18-25 WPM. Just passing the 5 WPM exam seems to be a pretty big accomplishment these days, judging by the percentage of new hams who don't even attempt it. Any ham who takes that first step is just as much a CW-ist as any FIST/QCWA/LifeMemberARRL/Extra class old timer... IF HE USES HIS NEW SKILL ON THE AIR.

You WILL find CW a lot more fun when you get up to 15-18 WPM. That is where it starts to resemble actual conversation. The flow of ideas gets much smoother as you get faster. You are less preoccupied with copying down each letter, instead you hear more words. Eventually you will reach a point where you don't actually write down what you hear, except for jotting down the other guy's call, QTH, RST, etc. Once you reach that stage it really is a lot more enjoyable.

True for you. Not everybody has that ability.

I have been doing CW for 46 years and have never been able to buffer more than 3-4 characters. Thus, all words longer than 3-4 characters are missed unless I write them down. Most human characteristics fall under the Bell curve. Just because you can do something doesn't mean everyone can do it.

I found the Mensa exam to be extremely easy and scored in the upper 0.5%. How about you?

Mensa exam????? Never took it. I really have no idea how I would do on it, and am not especially interested, unless membership gets me extra on-the-air privileges, discounts at the liquor store, etc. Sounds like just a bunch of people who hang out together just being amazed at how smart they are.

Seriously though, Cecil, what speed do you find CW comfortable to copy? Do you copy by hand on paper, or use the mill? A lot of ex military ops are so used to copying with a typewriter that during their formative years in the radio arts they got too deeply imprinted with the "hear the character, hit the key" method, and I guess this might be a stumbling block to head copy. Anyway, after 46 years, I guess you must have your methods pretty much ironed out, and have no need for the ability to head copy. Lack of a need to learn can be a big stumbling block. Still, I like to think that MOST (No not all) new hams can learn to head copy conversational Morse Code in less than a year if they are motivated and if they practice using proven methods. For many, (Myself included) this only takes a couple of months.

Funny thing is, I can't for the life of me copy anything over 30 WPM except WLO's WX broadcasts. Try as I might, there is a wall up there for me and I just haven't been able to crack it yet. Go figure. Maybe I AM doing it wrong HI.

Agreed, and well put. Apparantly it is a big accomplishment, and a lot of
those who do accomplish it will most likely put it to some use. (yes some
won't.... but many will)

Yes. If you enjoy it and want to get better at it, by all means, indulge.
However, beyond a certain arguable minimum, should we really tie CW
prowness to expanded phone band privileges? How about linking it with
expanded CW subband privileges? Should not the CW tradition in ham radio
be strong enough to stand on its own?

Jim - thanks for your thoughtful reply.

When replying to someone that mentions the code - first attack him for being a lousy no code tech (even if you don't know if he has passed a code test or not). Then proceed to diminish his credibility by chiding him for mentioning a technology that ham gear makers have not yet embraced.

Always move the discussion from the technical merits of one mode or another to personal attack, always.

Your one mistake however, Jim, is assuming that the person you attack actually gives a damn about what you have to say.

Have a nice day.

Forgot to mention that my cordless phone actually operates in the 900MHz ham band. It is a fine example of a mode that makes efficent use of spectrum and is capable of sharing the band with hams who use somewhat less efficent modes, like CW, SSB and NBFM.

yep. that's why not many people come toward ham radio. also, hams
are very proud of their licenses... and they take care the licenses as
diamonds. crazy guys are out there. we should all quit amateur
radio and leave strangers alone.

Yes, American air command centers are unable to confirm that there is a
new satellite up given the parameters the N. Koreans offered. I suspect
the satellite story is a ruse make the launch over Japanese airspace
look more legal, that if it was just an IRBM test designed to slightly
overshoot Japan, to say....send Japan a message.

It is even more disturbing that a large number of hams DO believe it.

Counting to ten....

May I be so humble to ask as to which law of physics is inoperative on
ham HF frequencies that allows Morse to be the most efficient means of
communications possible? What criterion for efficiency are being used?

By almost any objective measure I can come up with, Morse is a very
inefficient communications scheme. It doesn't operate anywhere near the
noise floor. It uses excessive bandwidth given the datarate achieved.
It requires extensive user training.

Is it fun? For many, obviously the answer is fun. But efficient it is not.

Does it disturb you in the least that a $40 commercial item uses technology
far beyone the dreams of anyone operating on HF? It bothers me.

* AMSAT-BDA WEB SITE MOVE *
==========================
The Station Program setup and patch files have been moved and are now
located on the AMSAT-NA web site:

http://www.amsat.org/amsat/ftpsoft.html#win-tsp

Thanks to Paul, KB5MU for finding AMSAT-BDA and Station a new home.

[Info via Paul Willmott, VP9MU, AMSAT-BDA]

* TMSAT NEWS *
==============
Chris Jackson reports that TMSAT is still undergoing testing by controllers.
Most of the systems have been tested and are operational. The downlink was
still only on over Europe and Bangkok last week.

The imaging system has been utilized quite considerably to calibrate the
cameras. Controllers downloaded the first multispectral image of San
Francisco Bay area last Tuesday, and it was really quite impressive.
Images received from TMSAT wil be posted to the Web when controllers
have finished analyzing the results of the camera offset calibration.

* RS-12 NEWS *
==============
Rusty, NM1K, reports that Jody, VP5JM, is scheduling RS-12 contacts. Rusty
contacted Jody via RS-12 in the latter part of August. Rusty also reports
that he, in fact, did work TF3TK in Iceland on RS-12.

* RS-15 NEWS *
==============
John Heath, G7HIA, in central England reports recently trying RS-15 on a
near overhead pass on 1998-Sep-05 at 2100 UTC. John heard no beacon, but

his return signal was very strong and suffered little from QSB between an elevation of about 30 degrees up to TCA. Just after TCA as the bird was going away, his signal went right down to about S3, and then quickly disappeared into the noise. Calling CQ with a downlink frequency of 29.377 MHz yielded no takers. John is running about 20 watts to a 5 element RHCP yagi to access RS-15.

* FO-20 NEWS *
==========
Peter, NH6VB in Hawaii reports that several Hawaiian stations are making extraordinary efforts to give mainland stations a chance to work KH6. At 18:40 UTC on 1998-Sep-06, AH6HH, WB6FZH/KH6, and NH6VB were all active on FO-20. Peter reports that besides the usual stations working KH6 daily, no one else was around from the West Coast or Alaska. KH6 is now very well represented on all analog satellites. All you have to do is listen and talk to the stations currently active

* MICROSCOPIC VACUUM TUBE DEVELOPED *
==========
Ian Gill, ZL3TGK reported in a recent QNEWS report that a microscopic electron tube has successfully been constructed by a researcher in the Netherlands. The triode measures less than 5 micrometers across and is etched in silicon using the same process used to produce integrated circuits. The tube uses a pin-point field emitter rather than a filament heater to generate its electron flow.

2038. How To Use Kepelerian elements

Newsgroup: rec.radio.amateur.space
Date: 1998-09-08 00:00:00 UTC
From: Dave Sjolin <sjolin@swbell.net>
Message-ID: <35F59912.FA7D494F@swbell.net>
Source record: 15280

For years I got my Kepelerian elements off of Compuserve. Lately I have been picking the file off the internet as a text file.

My problem is that I have yet to figure out how to successfully input the file in my tracking software (Instant Track). I have tried eliminating some of the headers and stuff but nothing has worked.

A number of times, Instant Track suggests that it read in the file but if it goes much quicker than in the past and if I go into edit, the date is still May of 98.

It is probably something simple but I need help. Respond here or email me at Sjolin@swbell.net

Tnx es 73 de Dave, N0IT

>not). Then proceed to diminish his credibility by chiding him for
>mentioning a technology that ham gear makers have not yet embraced.

It doesn't matter what code tests you passed or didn't pass, Richie. You might have passed a 40 WPM code test, but you don't have a LICENSE to operate Morse code on the HF ham bands, so you aren't qualified to judge what works and what doesn't work when it comes to Morse code.

Sounds like you've got a bad case of the no-code tech rash on your ass, Richie. As I said, had you ever used Morse code, you'd probably more easily understand the statement. We don't use digital spread spectrum cell phones on the ham bands because we aren't allowed to, maybe that's why Kenwood isn't making them yet....

Nobody called you a lousy no code tech, Richie. You called yourself that. Little inferiority problem, or just a bad case of mic envy? Before you preach about what works and what doesn't, how about trying it first. You don't have any credibility when it comes to Morse code on the HF ham bands, so there is nothing for me to attack.

You are just a wet behind the ears whiner who doesn't want to take a code test, so you stop by here and proclaim how rediculous something is that you never tried, and then you have the gall to get upset about when somebody doesn't agree with you.

>Your one mistake however, Jim, is assuming that the person you attack
>actually gives a damn about what you have to say.

Nobody gives a damn about anything anybody says here, Richie, that's the way the program works. You must have just gotten off the bus.....

You have not practiced to fluency, which takes lots of
listening. You
tend to want to do all the talking. No surprise that you haven't
accomplished
code fluency.

And the reason you can't dunk a basketball is that you
have not practiced enough. No amount of practice is
going to increase my buffer memory capabilities, Dick.
Everyone has a limit. Mine is 3-4 characters. God
engineered me that way. It's not just Morse code. I
cannot remember a telephone number if it is given to
me verbally. I cannot recognize a word if it is verbally
spelled to me and is more than 4 letters long. After
5 characters, I forget what letter the word started with.
No amount of CW practice is going to overcome that
biological limitation just as no amount of practice at
dunking basketballs is going to overcome your biological
limitation.

Everyone is NOT like you, Dick. You have your God-given
talents and I have mine. If 47 years of practice doesn't
lead to fluency, I ain't never gonna be fluent. I have
practiced as much as 15 hours a week for weeks on end
and my buffer memory is still limited to 3-4 characters
just as it has been since birth.

Source record: 15286

It really is not all that hard but there are a couple of traps of which
you should be aware. First when you edit be sure that there is no blank
line between the first kep element and the top of the screen. Be sure
that there is no commentary other than the elements itself line after
line. Use the AMSAT format if you can as there has been some
difficulty with the NASA two line.
Then simply hit five then three in the menu, answer the question QK: (file
name) AMSAT. It should update rather easily. There are some traps such
as not having the proper satellite in place beforehand, but in general,
the routine works rather well. Cliff K7RR

I don't know. Human speech runs about 150 WPM, we are not really not
talking apples to apples but taking in what I have heard, CW at 150 WPM
would not offer much in SNR ratio.

EXCUSE ME?
Where in part 97 does it say that FM cannot be used for satellite work? AO-27 is a FM bird... There are no questions in any of the exams on FM usage inside of the allowable frequency allocations with respect to satellites. There are DEFINITELY no questions about FM or satellite usage in elements 1(a), 1(b) or 1(c). I've seen more problems on the air from hams who were licensed before the first satellite was launched and haven't been retested since then.
Everyone who has worked satellites has made mistakes, but most of us have learned from our mistakes. Others have helped us, and, hopefully, we are hepling others. (by the way, since you "know" that the FM'ing were "no-code techs", you must know their callsigns and hopefully you contacted them with constructive information and helped them to improve their operating techniques.)

Not on the ham bands. A typical HF SSB QSO, including pauses, would
probably be less than 75 WPM.

The beacon is OFF most of the time, but the trans-
ponder should be ON (at low quality). Very badly
to hear myself back here in northern germany.

If you want to smile again :) open your ears to the
beacon of RS-12, it is wishing a merry christmas
and a happy new year !

Well, in what context did he state those remarks? What did you say that
prompted him to make that statement? You've got to place us in the same
scenario as when those remarks were made if you want valid opinions from
us.

>Pick up your cordless phone.

Try to build one from scratch. Ham radio not just about using radio
equipment, but also developing the skills to build equipment, too.
What radios are you operating on the air which you've assembled your-
self, Richie?

We could say that "efficiency" of a particular mode might include:
effort needed to collect components, time needed to assemble
the components into a working radio, finding and eliminating
any "bugs" - get the idea, Richie? I can assemble a working CW
transmitter in a matter of a few hours using components from a
TV set. On the other hand, how long will it take you to assemble
your 900 MHz phone? =:o (Gary: The receiver might take more
than a few hours, but it's really not all that difficult; lots
of the fellows on the homebrew e-lists are assembling and using
regens [designed in a modern context]).

>If you purchased it in the last year it is
>probably operating with a digitally encoded spread spectrum mode. Seems to
>me that is damn efficient, given loads of these phones can operate at the
>same time, in the same narrow band of frequencies, with NO interference.

Can I use it to find someone on 40m for a chess game? Can I use it to
hold a Pacific island round-table net on 30m?

>CW is fun, it can get thru QRM where SSB and other modes fail, but it is
>100+ year old technology.

Verbal communications is thousands of years old - but the SSB and FM
folks are still using it.

Now, next time you start a CW/code thread, please use the newsgroup
which was created for such remarks: rec.radio.amateur.policy

Just because you don't have a $40,000 spectrum analyzer in your shack
doesn't
mean that you can't build a transmitter. When was the last time the FCC
fined
anyone for anything that wasn't willful and deliberate? The most they
would do
to you is point out that you have a spur and would you please correct it
and
let them know what action you have taken. I don't know that they even do
that
anymore, they seem to be firing most of their technical staff in order
to hire
more lawyers.

I have the TS-790. It has the 23cm for when P3D Gets launched. Can't buy a new one anymore though. You can't buy a new IC-970 either. Wait and see what the new rig Kenwood comes out with. I'm sure you'll be happy with a Kenwood.

Just because the FCC has fallen down on their job, we shouldn't
encourage use of dirty transmitters. While a *new* spectrum
analyzer may cost $40,000, perfectly servicable older units can
be had for well under $1,000. You can even *build* one, there was
a construction article in QST the last two issues, and Science
Workshop still sells their kit based on a TV tuner. Simple, cheap,
and adequate to see if your transmitter is clean. With a bit of
patience, you can even bench check it with a general coverage
receiver and an attenuator. Failing all that, at least take it to a
friend who *does* have the proper test equipment before putting
it on the air. There's no reason to interfere with other amateurs
because you don't personally own the test equipment to certify
that your Tx meets FCC specs.

True most of the time you don't get hit with a fine , but the rules are strict about spurs etc.
It is possible to get hit with a fine if the spur causes some real problems , like a leak at 121.5 mhz for an example.
But the point was about the level of strain . looked to me like the flames where about to cloud the issues, and cause some hate of other guys point of view. It is a hobby not a job.
if it all went away tommorow it would be missed but not many hams would starve for lack of work. the point is hobbies should be fun, not a source of high blood pressure.

2064. SATELLITE SOFTWARE - HOW IT CAN HELP YOU!

Newsgroup: rec.radio.amateur.space
Date: 1998-09-10 00:00:00 UTC
From: emanuel.marques@NOSPAMmail.telepac.pt
Message-ID: <35f84ea5.29376086@news.telepac.pt>
Source record: 15157
Cross-posted to: rec.video.satellite.misc,rec.radio.amateur.space,rec.radio.amateur.misc,rec.radio.amateur.equipment

Many people don't know that the right software program can be of great help, even for the non professional dish installer (DIY). Others are reluctant to use satellite software because they think it's too complicated to use or even useless.

This is not a FAQ about satellite software, but an attempt on my part to try to better inform potential users about the benefices of using satellite software.

I. WHAT IS SATELLITE SOFTWARE?

II. ABOUT SKYSOFT SOFTWARE.

III. IS IT USEFUL FOR ME?
A) I AM A PROFESSIONAL DISH INSTALLER.
B) I AM NOT A PROFESSIONAL.

IV. SKYSOFT SOFTWARE AND OTHERS

I. WHAT IS SATELLITE SOFTWARE?

There are several types of "satellite television software". Some are dedicated to help professionals and DIY dish installers to setup satellite systems. Others are meant to emulate viewing cards used by encrypted channels. Another more recent type of software is meant to replace the original software of some satellite receivers in order to add new features.

II. ABOUT SKYSOFT SOFTWARE.
Skysoft is the name of my project dedicated to satellite software tools. I am only interested and dedicated to developing engineering software (dish aiming , downlink budget, etc.).
Currently I have three software programs available; EASYSAT, PCSAT, and ARQSAT.

You can find more information about Skysoft and the software at:
http://www.sat-net.com/skysoft/

III. IS IT USEFUL FOR ME?
A) I AM A PROFESSIONAL DISH INSTALLER.
The true professional plans receptions systems. It is hard to imagine someone doing all the required calculations one by one. Nor is it acceptable to use the trial an error method or go by the word of mouth to determine minimum dish size, for example.
A good software program can save you time and money!

B) I AM NOT A PROFESSIONAL.
If you are planning to buy a satellite system EASYSAT (just 25 USD!) can be a great help:
- Find what satellites you will be able to aim to.
- Find what satellites/channels you will be able to receive.
- Find the optimum dish size for your location and for the channels you want to receive.
- Help you better understand how satellite television reception works, and how individual components and parameters affect system performance.

If you already have a satellite dish system:
- Help you diagnose reception problems (satellite signal is too weak, dish is to small, deficient dish aiming, etc.)
- Help you decide on equipment upgrades (how much bigger the dish should be, will a lower noise Lnb "do it", etc.)
- Help you better understand how satellite television reception works, and how individual components and parameters affect system performance.

IV. SKYSOFT SOFTWARE AND OTHER SOFTWARE PROGRAMS.
There are other software programs that perform similar tasks, in what ways are EASYSAT and PCSAT different?

Being a long time user of satellite software myself, I have found that available satellite software falls into two categories:

1) Programs with many functions, but unfriendly and too technical for most users.

2) Programs easy to use, but with few features, "over simplified", and easily outdated. These are usually free programs sponsored by satellite equipment manufacturers and therefor are designed to work with only a particular brand of equipment (dishes).

Having practical knowledge of satellite systems design and installation. I have been integrating really useful functions and features to my software programs. Some of them are exclusive of my software, which makes them arguably the most user friendly and useful software for the typical professional and DIY installer.

For more details, please go to the Skysoft Web Site at http://www.sat-net.com/skysoft/

A reasonable average (it varies depending on your latitude) is around
111.2 kilometres per degree of arc along a great circle. Sorry I don't
have a figure for "miles" but the conversion should be easy.

At the equator one degree = 60 nautical miles, approx 111 km.
Distance between degrees of longitude varies with 1/cos(lat)
Radius of earth also varies with latitude.

In my previous followup, I should have written that the distance
between degrees of longitude at constant latitude varies as cos(lat)

Also, at the equator, 1 degree = 60 nautical miles = 69.05 statute miles
= approx 111 km.

Radius of earth still does vary with latitude--we have a bulge around
our middle.

K6FV

2068. Re: How many miles are there in one degree of travel around the earths surface?.

Source record: 15161

It varies depending on which direction you are going and what latitude
you are at. At the equator, one minute of latitude equals one nautical mile
which equals 6076 feet. One mile equals 5280ft.

6076/5280 = 1.15 aprox.

60 minutes to a degree so

1.15 x 60 = 69

so 69 miles to the degree traveling east west on the equator or
anywhere north south.

I know I could have just given you the answer, but wasn't it
more fun this way. BTW all the numbers were found in my dictionary.

Aw come on fellows! There is absolutely no need for a confusing, complex
program to find the position of any satellite in synchronous orbit!
There is a simple, single page nomograph in which the satellites
suborbital point is entered and the azimuth and elevation is obtained.

If there could ever be a better example of why it takes a computer
to really screw up something simple, this is it!! Cliff K7RR

I think Richie Allen is correct in that digital(CW) is the most
efficient means of communication. History tells us so. For instance, the
Indians used smoke signals and drums to communicate over long distances.
The military until recently relied on CW as a means of communicating
during war time. Even though the military is not using CW now, they are
using another form of digital communication. Imagine this: several
trained soldiers positioned around the world with very simple equipment
relaying messages around the world using only CW. CW is simple, with few
choice components and a sheet of paper describing morse code a high
school student could build a TX/RX CW radio and communicate around the
world! To the military that is power! CW uses the computer we all have,
our brain. I think that what makes CW most valuable is that when
atmospheric conditions change a dot is still a dot and a dash is still a
dash. This is not true of Voice communication. Note, efficient is wrt
humans sending and receiving messages using CW. For those purists,
please assume we have a CW capable radio.

Yes, but didn't they lose? ;-)

> The military until recently relied on CW as a means of communicating

The military relied on Morse for a very short time actually. I think you will find pennant flags and semaphore have been relied on for much longer than Morse.

> Imagine this: several

This is a joke, right? I suggest that you go to the local library and look at modern tactical and strategic communications. Why do you think they have invested all that time and money getting video onto HF, encrypted data communications and satellites when all they _really_ need is "several trained soldiers positioned around the world" "using only CW"?

> CW uses the computer we all have,
> our brain. I think that what makes CW most valuable is that when
> atmospheric conditions change a dot is still a dot and a dash is still a

Have a look at the error corecting modes like PACTOR and then compare them to operator Morse. You will find that PACTOR will still work when a dot is no longer a dot to the ear.

> Note, efficient is wrt
> humans sending and receiving messages using CW. For those purists,
> please assume we have a CW capable radio.

You are comparing apples and pears. If you want to compare the properties of Morse using OOK, then you have to compare it to another non-verbal digital mode. If not, you have to take the emotion content of the voice into account as it conveys information that Morse finds very difficult, if not impossible

to convey. In this respect Morse is always very inefficient.

Unless you are talking about poor SNR conditions, voice is a more efficient method of communication for the simple fact that it uses a wider bandwidth and is therefore inherently capable of transferring data at a higher rate.

Efficiency is a term which has no real meaning until there is defined criteria against which it is measured. In poor SNR, CW is more efficient, in good SNR, voice is more efficient.

No he's not. He is comparing modes which are likely to be available
to anyone who finds himself in the position of considering the use of CW to
actually communicate. Beyond that no comparison is valid.

That's correct John, AO10 is at a sun angle off one end or the other of the satellite. It is predicted to spend at least two months in this mode before it again receives enough sunlight to come back to life. I believe it has already been dead for about a month.

Thanks for that Rick - knowing my luck by the time it's working it will
be available here in the UK at unearthly hours again :)

There don't seem to be many voice sats about - plenty of data types
listed - a pity, from my point of view anyway. I'd rather have a short
natter than stare at a screen.

Starr report available on Bafoofnik's Ham Radio Search Engine

http://www.qth.com/stamper/search/bafoof.htm

2083. The W8MMQ Web Site

Newsgroup: rec.radio.amateur.space
Date: 1998-09-12 00:00:00 UTC
From: "Daniel Hicks, Jr." <w8mmq@juno.com>
Message-ID: <6td1c0$dbv@news.voyager.net>
Source record: 15176
Cross-posted to: alt.alien,alt.pirate.radio,alt.radio.free,alt.radio.pirate,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

Several users have complained that they are unable to connect to the W8MMQ web site. For that matter, people have been complaining to the server admin about the content of the web site. If you don't like the site, then just don't visit it!

Anyway, I have set up a backup site, http://members.xoom.com/w8mmq/. Use this if you cannot access the site on QSL.NET.

Again, if you cannot "stomach" the web site, then don't waste your time visiting a second time, or complaining to me or anyone else about it. It is my site, not YOURS!

BTW. To download the complete Starr report, click on the nuns-with-guns pic on the front to enter the site, then scroll down to the Up Front section. Click on Starr report, to begin the download process!

WARNING: The file is in .ZIP format. It contains highly explicit material (language, etc) and should be read only at the viewer's discretion.

73 de,
Dan/W8MMQ

This announcement was made a month ago in the mailing lists 'wxsat-l'.
A number of ST columns are moving to the sister magazine Monitoring
Times.

I just read this morning in the paper that the State Department finally admitted that the North Koreans actually did try to sent a satellite into orbid (or is that already old news?). Funny that they admit it right after they closed a deal with them. They also said that it didn't make into orbid, so I guess I can stop listening to 27Mhz. now? :)

>Just imagine if they tried to put that satellite on 3898 or one of the
>many other open soars on the HF band. Yall have a good one.

Today the U.S government announced that they misinformed us about it being
a ballistic missile, it was a satellite launch attempt after all.
The previously undisclosed third stage may have malfunctioned and
the satellite apparently didn't reach orbit, unfortunately.

Whether 75 meters or 11 meters, I'm sure that many would find it more
interesting to listen to that satellite than the regular program material.
I had thought that the code luddites would appreciate the attempt to
convert the inhabitants of 27 Mhz by example.

It is not necessary to disparage Alabama when commenting on Korea.

I believe by any objective measure, Alabama is ahead of Korea in technology.
We even have internet access here. :-)

To alleviate your ignorance, you might want to know that Alabama is the home
of the Marshall Space Flight Center in Huntsville. It is where Von Braun
designed the Saturn V. It is where the Space Shuttle Main Engines were
designed.

Its also where the NASA Space Flight Museum lives, Huntsville. I really
enjoyed my visit to the museum where I saw all the wonderful rockets of
the 50's and 60's that I had memorized as a kid. They have the only two
remaining Saturn V's as well as a V2, Honest John, Lacross, Shuttle &
tank, Apollo capsule, and lots of weird stuff like a miniature submarine
used to recover rockets in the Pacific. I took this picture there:
http://www.qsl.net/k7yo/a65drone.html

Don't miss it if you ever have to go to Huntsville. I can't think of
anything else I'd rather do there...

Bert,

Don't know where you got that, but I didn't write it. I may have
appended a comment to it, but not anything that you quoted.

Having tracked sat's for the Airforce in the 60s (working for Lockheed),
I'm well aware of MSFC in Huntsville and the work that's been done
there.

I wasn't trying to encourage anyone from deliberately transmitting spurs,
and I certainly would encourage testing for spectral purity by whatever means is available, but I thought the original posting was a bit too negative, implying that anyone who can't afford expensive test equipment had better not dare to put a homemade transmitter on the air for fear of being fined out of house and home and being sent to Levenworth. Even when
the FCC was on the enforcement ball, they rarely if ever fined anyone for unintentional rules violations, they just sent you a notice in the mail with instructions to write back to them and tell them what steps you have taken to solve the problem.

The truth is out now. The missle had a third stage that failed to
ignite. It apparently carried a small satellite which of course went
into the drink. N. Korea lied and said the sat made it to orbit. The
scary thing is that with a working third stage, the range of that missle
to lob a warhead becomes 3500 statute miles; long enough to hit Alaska.

2108. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.space
Date: 1998-09-17 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6tqcv8$lk0@news.Hawaii.Edu>
Source record: 15201
Cross-posted to: rec.radio.amateur.space,rec.answers,news.answers

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Source record: 15206
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.equipment,rec.radio.amateur.space,rec.radio.amateur.homebrew

Hello, here's 3 questions I would like to be helped with:

1. Is $250 a good price for a Sony ICF-SW7600G?

2. Does someone know any frequencies of particular space missions/satellites/sonds?

3.Is it possible to homebrew a unit which could expand a normal AM frequency range (150-30000 kHz) to 100-300 MHz or more, so that it would work by connecting it to a normal worldband radio?

I appreciate help. Please return a possible answer to bartalzo@hem2.passagen.se, as well. Thank you.

Greeting from Zoltan, a VERY beginner radio-amateur whose knowledge in radiotechnics and electronics is VERY limited.

>missions/satellites/sonds?

My home page has a list. Also go here:

http://www.amsat.org/amsat/sarex/shutfreq.html

But just to help right now:

Space Shuttle/Mir Radio Coms - As of: 8/23/98

(Sarex is now known as the Space Amateur Radio EXperiment)

Space amateur Radio experiment (Sarex) Downlink: 145.550 FM
This is for both voice AND packet modes. So if you hear short
bursts of noise they are in packet mode.

Some amateur radio 2 meter FM repeaters carry live air to
ground coms. Go here to get a list of shuttle freqs around the country:
http://www.amsat.org/amsat/sarex/shutfreq.html
If your in the NYC metro area try the W2FCL repeater in Northern N.J.
on 146.610. I pick this repeater up from about 100 miles away easily on an
Icom 2000H and a Ringo Ranger vertical up about 27 feet.

On HF, WA3NAN - the Goddard amateur radio club
re-transmits the missions on: 3.860 LSB (all freqs. in single side band)
7.185 LSB
14.285 USB
14.295 USB
21.390 USB
21.395 USB
28.650 USB

These are dependant on propagation! In South Eastern N.Y. I pick them up on
the 80 and 40 meter frequencies (the first 2) the best.
They I.D. in morse code and voice. Park on a freq. and listen awhile,
coms are not non-stop! There are sometimes long breaks in the action.
When the astronauts are asleep they are off the air. If the weather is
bad at the station or no control operator is available they won't be
on the air either. This is a volunteer service. Thanks to WA3NAN for
providing this service!

Mir 2 meter FM amateur radio downlinks are currently on 145.800 (Europe)
and 145.985 in the U.S. These are for both voice AND packet radio.
So if you hear short bursts of noise they are in packet mode. They are
in packet mode most of the time, especially after 2000UTC.
(their 8 hour sleep period)

There is a ground control freq. of 143.625 FM that is sometimes
used as well, but NOT for amateur radio. I hope you speak Russian!

Mir is also now on 70 cm with voice downlinks on: 437.950
437.925
Packet downlink: 437.975

Happy listening!

I'd like to hear about this, too. I was going to wait until
I studied up a bit more, before making a post. But I just
recently acquired an old 10.5 foot satellite TV dish. Thought
I might be able to use it for radio. At least for P3D...

I would guess, as one who has a TVRO dish, but only a passing interest in EME and satcom, that for EME, the typical dish is too small and for satcom, it is too large, given that the later sats are sensitive enough to be accessed with an HT. Additionally, at least for satcom, an elevation positioner would be needed (plus modifying the typical dish support for elevation changes).

As I remember, a 10 foot dia. TVRO dish will provide about 40 dbi of
gain at 4Ghz if true (> 1/4" deviation over the whole surface).
At 2.5Ghz its about 30 dbi, I think, and maybe 20 dbi at 1.2Ghz?

Feedhorn illumination is a consideration, I suppose at the lower
frequencies you can illuminate farther to the edge without
too much background noise? A fence might help also.

If you mounted a microwave oven magnetron in the focus and listened
with an old MDS receiver, I'm sure you might hear yourself bounce
off the moon :-)

I am also interested in this. I recall reading in QST, within the last year
or so, about someone using a TVRO dish on 5.6 or 10 GHz for EME work. I
remember being impressed because he heard his own echos with only 20 watts.
Then called a CQ with 100w and got an answer. (I didn't think they did
things like call CQ on EME). Over the weekend I will try to dig up that
issue of QST so everyone can read about it.

Regarding question number one, I purchased one about six months ago at Ham Radio Outlet in San Diego for about $175. It was the display model and I got a discount because of that but I was thinking that the regular price there was only about $210. This price included the AC adaptor, the carrying case, and the clip on antenna.

BTW, I am quite satisfied with it. I am a Ham and only do occasional SW listening. It seems quite sensitive, even with the built in whip antenna. Not terribly selective or with a lot of dynamic range but more than adequate for the price.

Looks like the last thing the ARRL Board of Fools wants
is to listen and carry out the will of the membership. The
Board conducted surveys of the membership and then does
the complete opposite. It makes me so sick I could just
vomit. HEY ARRL, you want to save money? You can quit
having elections since you won't truthfuly represent
your membership anyway. ARRL will destroy a good thing
if it means more money in their pockets.

Rod Stafford, W6ROD was shoveling Bullshit when he wrote:

>Thanks for your input about the ARRL's licensing
>restructuring and testing proposal adopted by the
>ARRL Board of Directors a couple of weeks ago in
>Connecticut. Let me see if I can shed some light
>on some of the reasons for the proposed changes.

(Translation: We dont give a damn about your input, only ours.
Sorry you wasted time filling out our survey.)

>I am certain that some hams will find change itself
>to be very disconcerting. It is our nature to like
>things the way they are and the way they were. We're
>generally comfortable with that and not comfortable
>with change. In many instances, we would like to return
>to "the good old days" of ham radio. However, there
>are some very real reasons why amateur radio has to make
>some changes if it is to be around in the 21st century.

(Translation: We need to make getting licenses easy.)

>As amateur radio operators, we're slipping farther
>and farther behind on the technology power curve, and
>people take note of that. Take a look at the primary
>modes of communication we use: SSB, FM, CW, etc. Each
>of those modes of operation have been around 50, 60
>or 70 years or more.

(Translation: We couldn't think of any new modern modes that
would be popular, so we couldn't submit any ideas
with our proposal. Hope No one noticed.)

>I was traveling by airplane not long ago and the
>person sitting next to me was a retired electrical
>engineer.

(Translation: Your dues bought my plane ticket. League
money working hard for you.)

>As we chatted I told him about my involvement with
>amateur radio. He had a ham license about 45 years
>ago. He was amazed hams still use SSB, let alone CW.
>He wondered why the hams didn't use some of the more
>"modern" modes of communications.

(Translation: Not surprising, they won't use modern modes eihther.
We know most Techs haven't and won't try
satellite or even packet!)

>This is a typical reaction. We have to change people's
>perception of ham radio being a pursuit involving 70 year
>old communication techniques. One of the ways to help
>change that perception is to modernize our approach to
>CW.

(Translation: We can heap Bullshit on the issue and say CW
strangled the institution of modern modes, and
CW is blocking technology.)

>We're not eliminating it, we're simply trying to put it
>in its proper perspective as we move into a new century.

(Translation: Are we bold enough to propose the total
elimination Of CW? No, but our proposed new
easy licenses will still please thousands
Techs, CBer's and other non-hams. We'll gain
their favor, and memberships.)

>CW will be around for a very long time as one of the
>modes of communication for amateurs. However, as
>an examination element, it carries much more weight than it
>should at the present time.

(Translation: We're losing membership dollars because many
potential members reject learning CW and won't
join us unless they can have HF for free. We
hear their cry.)

>I believe the League proposal will put CW into a more
>proper perspective in the examination context as we try
>to bring amateur radio into the current technological
>environment.

(Translation: Hope we can fool our grass roots support, old timers,
and pro-code League members with this Anti-CW Bullshit
membership drive technology rhetoric.)

>I don't think there are many people who see CW as the
>future of amateur radio. If they do, in my opinion they
>are looking backwards, not to the future of ham radio.

(Translation: Pro-coders are backwards and their arguments
interfere with our membership drive.)

>And, as I mentioned, we're not eliminating CW. There
>will be plenty of people operating CW just as they have
>for years.

(Translation: We want to eliminate CW, but our life members
would die of shock. We'll call for the total
elimination of CW in our next proposal.

>Most non-hams think of ham radio as a hobby. And as a
>matter of fact, most hams think of amateur radio as a hobby.
>Sure, the League tries to stress the emergency communications
>and the public service aspects of amateur radio to those that
>are unaware of that role and people outside of ham radio do
>have some understanding of that role of amateur radio. It is
>certainly one of the first things I tell people about amateur
>radio if they have no acquaintance with the amateur service.
>However, the bottom line is we're viewed as a hobby.

(Translation: Maybe we should mix in some truth with the Bullshit.)

>The point is, we have some very valuable spectrum that is
>available to us for hobby purposes, and yes, even for our
>public service activities. It has become more and more
>difficult in recent years to justify retaining our spectrum
>from commercial interests who make some very good arguments
>as to why they should be allowed to use our spectrum for
>endeavors that will generate jobs, used advanced telecommunications
>techniques and put the spectrum to use for commercial purposes,
>not just for hobby purposes.

(Translation: Hope the commerical companies seeking spectrum
will believe us when we say ham radio will get
more technological and that we're not just
spreading more bullshit.)

>Even considering the perception that what we do is a "hobby,"
>we can counter some of that perception that we're "a dying breed"
>clinging to old technologies when we can show that amateur radio
>is a vital, growing activity. One only has to look at the statistics
>in the last few years to find that to be untrue. In recent years
>the average age of a active ham has crept up to nearly 60 years old.
>The growth rate of new hams coming into the service is at an
>all-time low of less than 2%. That doesn't even keep up with the
>"loss rate" of people who die or simply leave amateur radio for
>various reasons. The argument that we need to retain spectrum for
>the growth of amateur radio in the face of dwindling numbers is an
>unconvincing one to anyone, like the FCC and commercial interests,
>who takes a moment to look at the numbers.

(Translation: If we don't get new hams we're going to have to
swallow a decrease in our salaries. We can all

have raises when all those CBer's come on board
with the new easier licenses!)

>Taking these factors into consideration, the perception of ham
>radio is one of an aging group of hobbyists who use "less than
>state-of-the-art" communication techniques. We may not like that
>perception but that is what it is in many circles of the
>communications industry.

(Translation: Guess improvements in transmitter & receiver design
and DSP don't count as state-of-the-art if the
transceiver is sending CW!)

>The changes proposed by the League are not the total solution to
>the problem. We still have to make an effort to move into more
>advanced communication techniques in the near future. We need to
>take advantage of some of the more cutting edge modes of digital
>communication to allow for more efficient use of the spectrum.
>The Board of Directors is aware that merely restructuring license
>classes and modernizing the CW testing requirements is not the
>whole answer.

(Translation: If we must destroy ham radio to save it, then we'll
do it! Our jobs are at stake!)

>The League is going to have to take the lead in promoting
>technological advances within amateur radio even if it is just
>stressing the idea that amateurs put to use in amateur radio some
>of the techniques used by the commercial services.

(Translation: We can't promote technological advances now because
that darned CW mode keeps getting in the way.)

>And it's not just the League that needs a different mindset to get
>us into the next century with a vital amateur radio. For example,
>we might persuade repeater coordinators to give priority to
>sanctioning repeaters that are going to be using advanced digital
>modes rather than the 50 year old narrow band FM mode.

(Translation: Hmmm, We still can't figure out how to get hams to
accept the current new modes. We'll just say we're
working on it.)

>We might even persuade radio manufacturers to market HF radios that
>use other modes than CW and SSB as the primary modes of communication
>below 30 MHz. There are digital techniques that can be applied to
>the amateur service that would make more efficient use of the
>spectrum and minimize the interference potential between stations.

(Translation: We know a CW signal takes less bandwidth than other
modes, but we'll throw out this bullshit that there
might be other modes that are more spectrum efficient
than CW and see if anyone buys it!)

>I suppose the bottom line is we in amateur radio have to start
>thinking about the future and where we want amateur radio to be
>in the future.

(Translation: If our ham bands sound like CB channel 19, who cares?
At least we'll have more members.)

>Changes within ham radio have been suggested for quite a number of
>years. The pressure for change has been building. The FCC has had
>a continuing stream of proposals from individual amateurs to make
>significant changes over the last ten years or so. The League, for
>various reasons, has resisted such change, myself included. However,
>I think the proposal the League recently adopted will move us as
>amateurs in the direction we need to be going.

(Translation: Just send in a FCC 610 form for a Ham license. No
test required!)

>I also have to make a comment about the "motives" of the members of
>the Board in making such a proposal. Some have said the move was
>to make sure more radios were sold. Some have said it was to
>attract more members to the League. I can state without any
>hesitation that the Board acted in the best interests of amateur
>radio and for no other reason. Most all of the members of the Board
>have been amateurs for 35 years or so and some even much longer.
>These are not people who want to see amateur radio be hurt in
>any way. They don't spend 30 or 40 hours a week working on amateur
>radio matters for anything other than the benefit of amateur radio.

(Translation: We're concerned about our pocket books, and are as
crazy as Wayne Green.)

>I don't think there is anyone on the Board who cares how many radios
>Yaesu, Icom or Kenwood sell. Those companies are involved in other
>commercial activities and the amateur radio segment of their business
>is not large to begin with in the context of their entire commercial
>enterprise. If one or more of those companies should leave the
>amateur radio market, some other company will fill the void and market
>amateur radios. Of course, that assumes there is an amateur radio
>service.

(Translation: They'll pay us lots of Dollars to advertise in QST.)

>The League would certainly like to have more of the amateurs as
>members.

(Translation: But CBer's are just as acceptable.)

>I certainly don't dispute that. But that doesn't mean it
>will benefit any person on the Board if the League has additional
>members because we are volunteers to begin with. We don't get paid
>and we certainly don't get any bonuses if additional members join
>the organization. It actually means the League can provide more in
>the way of services to the members more than anything else.

(Translation: Our easy license proposal will make thousands of CBer's
feel welcome.

>The changes proposed by the Board are needed. Other changes along
>the lines that I mentioned are also needed for the amateur service
>to continue to be a growing, valuable service.

(Translation: More mindless Bullshit! We haven't a clue.)

>I would hope that you would consider these factors in assessing
>the need for and the effect of the League's proposal. There's no
>reason the changes are being suggested other than they are needed.

(Translation: With our proposal ham radio as we now know it will
be dead in five years and our ham bands will sound
like CB.

>I have resisted engaging in any debate about the pros and cons of
>CW and how it is or is not a filter for "quality" amateurs getting
>on the HF bands. There are plenty of people who will spend hours
>and hours debating that subject. I don't. Not only that, it misses
>the whole point of why the Board suggested the changes it did. If
>you have an urge to do that, I can suggest some internet newsgroups
>where that debate has been raging for years and with no satisfactory
>conclusion I might add.

(Translation: I won't argue with the hams who want the best for
ham radio, they always win!)

>Incidentally, I have drafted this response to send to a number of
>individuals who have written or e-mailed me on the subject of the
>restructuring and testing proposal so if a ham friend says he
>received the same response or it appears in electronic form
>somewhere, that is the reason.

=========

MONDAY SEPTEMBER 21, 1998

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for non-commercial use.

* OSCAR-11 NEWS *
=================
Its been another uneventful month for OSCAR-11. During the period
1998-Aug-15 1998-Sep-15, good signals have been received from OSCAR-11's
145.826 MHz FM beacon. Telemetry has been nominal, and the battery voltage
continues to improve, averaging 13.8 volts, with values ranging from 13.6
to 13.9 volts observed.

OSCAR-11's internal temperatures are slowly increasing and are now 6.6C
and 4.8C for battery and telemetry electronics respectively, thus indicating
an increase of about 3C during the month. This is due to the decrease
in solar eclipse times, which is improving the power budget without
creating excessive internal temperatures.

The single WOD survey of channels 1, 2, 3, 61 (magnetometers) dated
1998-Jul-01 which began at 16:24:09 UTC has is still being transmitted
by the satellite.

A report of the OSCAR-11 Mode-S beacon has been received from Ted, WA2HKS,
who has heard the beacon many times during the last two months. Many thanks
Ted.

The operating schedule remains unchanged:

ASCII status (210 seconds)
ASCII bulletin (60 seconds)
BINARY SEU (30 seconds)
ASCII TLM (90 seconds)
ASCII WOD (120 seconds)
ASCII bulletin (60 seconds)
BINARY ENG (30 seconds)

The ASCII bulletin is currently a static message detailing modes and frequencies of all the amateur radio satellites. Additional status blocks are currently being transmitted after each news bulletin and between ASCII TLM and WOD.

The Mode-S beacon is ON transmitting an unmodulated carrier, but telemetry indicates that it has partially failed, and delivering half power. This beacon is a useful test source for those testing Mode-S converters, prior to the launch of P3-D. It is considerably weaker than DOVE, which should be used for initial testing. Any reports of reception on 2401 MHz would be most welcome, and should be directed to Clive Wallis at: g3cwv@amsat.org.

The 435.025 MHz beacon is normally OFF. However, it can sometimes be heard when the satellite is being commanded by ground control, ie. within range of Guildford, UK. When the 435 MHz beacon is transmitting, the 145 MHz beacon is normally OFF. The data transmitted is mainly binary.

Listeners to OSCAR-11 may be interested in Clive Wallis's OSCAR-11 web site. The site contains details of hardware required and some software for capturing data and decoding ASCII telemetry and WOD. There is an archive of raw data (mainly WOD) for analysis which is continually being expanded as new data is captured. Also included are some audio files including examples of each type of data transmitted by OSCAR-11. Each one plays for about ten seconds. There are also examples of Mode-S reception. All the audio files are zipped, so that they can be played off-line. These should help listeners identify the various types of data and give an indication of the signal quality required for successful decoding.

Two new Whole Orbit Data software packages were recently added to Clive's OSCAR-11 Web site. The first package, ORBILL.ZIP, enables various WOD channels to be compared with the solar eclipse status of the satellite. The second package, U2MAG1.ZIP, compares measured and calculated magnetic fields encountered by the satellite. Both packages are of an advanced nature, especially U2MAG1.ZIP, which is rather complicated! Users will need experience of using the other WOD packages on the web site as well as a spread sheet program. The URL is:

http://www.users.zetnet.co.uk/clivew/

[Info via Clive Wallis, G3CWV]

* UA3CR - SK *
==========
Peter Guelzow, DB2OS, sadly reported that Leonied Labutin, UA3CR, died of a heart attack on 1998-Sep-10 at his summer residence near Moscow. Pat Gowen, G3IOR, reports that Leo got thoat cancer some years ago, and was only able to communicate with him on a regular basis by means of packet radio or CW.

Peter stated that Leo was a very well known and respected person in the Russian amateur satellite and space scene for a long while, and was very active until his death. He was on the South Pole after the launch of RS5 through RS8 for testing Store & Foward techniques from such remote locations. He also assisted the North Pole Bearing bridge Transpolar Ski Trek Expedition

between the USSR and Canada in 1989 that included communications via Amateur Satellites. Leo was directly involved in various RS satellite projects, and helped to negotiate the delivery of amateur radio equipment to the MIR space station. Leo also operated a mailbox system and digipeater in Moscow with a regular Gateway to UO-22. He was also one of the first groundstations and gateway for the Digital Communications Experiment on UO-11.

Leo will be missed by the entire amateur satellite community.

[Info via Peter Guelzow, DB2OS]

* AO-27 NEWS *
==============
If anyone needs Hawaii and/or Alaska on satellite, now is a good time to try AO-27. In the past couple of weeks, Hawaii and Alaska have been quite active on AO-27. As always, make sure you can at least copy callsigns before transmitting on AO-27 so you don't cause QRM. AO-27 has a very sensitive receiver and it is rare that someone isn't active on AO-27 on North American passes. AH6HH has been especially active over the past week, and is making special efforts to give folks on the mainland a chance to work the Islands.

[Info via KD6PAG]

* FO-29 NEWS *
==============
Kazu Sakamoto, JJ1WTK, reports no new information regarding the operation of the FO-29 satellite. The satellite continues in Mode JA.

* THANKS! *

2138. TVRO Dishes for EME

Newsgroup: rec.radio.amateur.space
Date: 1998-09-21 00:00:00 UTC
From: treynolds@my-dejanews.com
Message-ID: <6u6bgrllp1@nnrp1.dejanews.com>
Source record: 15231

Last week on this newsgroup several posts were made on the subject of using TVRO dishes for EME work. A small amount of information on this subject and a couple of examples of people using them is in the March 96 issue of QST in the column 'The World Above 50 MHz.

Indeed I can can from tell merely from looking at the results
of my computers efforts to deocde Morse. I can normaly tell a
straight key from a keyer (by the errors they each make) some of the
later I know by call sign (they use some kind a macro funtion to send
there CQ call letters, but make error in the rest)

Message-ID: <87hfy0tzhg.fsf@TVR-LINUX.THEOS-Software.Com>
Source record: 15238

I am also interested in this. I recall reading in QST, within the last year or so, about someone using a TVRO dish on 5.6 or 10 GHz for EME work. I remember being impressed because he heard his own echos with only 20 watts. Then called a CQ with 100w and got an answer. (I didn't think they did things like call CQ on EME). Over the weekend I will try to dig up that issue of QST so everyone can read about it.

They are also be useful for SETI work when they're not actively in use for amateur purposes. Try:

http://www.setileague.org

And specific to this topic:

I have a 12 foot mesh disk that is free for the taking.
It has been taken down and is in storage.
The disk is located in Lawrenceville, GA
Email for more info and pick up times.

I also have a set of panels for a 9 foot dish and some hardline.

Seems as though things are looking up at the ARRL. With two
anonymous trolls leaving, the ratio of losers to amateurs just
dropped a little. Maybe we'll get lucky and they'll sell their
amateur gear.

Are you willing to be one of the "Elmers" who teaches them by
example and gentle explanation why they are doing something
laughable or are you just one of the bystanders who will be
hurling rocks?

How long have YOU been a ham ?? (46 years for me, the last 40
on "local 2 meter repeaters".)

Hola OM:

Ya podemos informar de los precios y programas definitivos del Congreso RedURE Zamora'98. Podeis ver las nuevas noticias en la p�gina Web de AMSAT-EA en la direcci�n de costumbre:

http://aintel.bi.ehu.es/~amsat-ea

all� est� el enlace al Congreso RedURE Zamora'98 con las siguientes nuevas informaciones:

-Programa definitivo para los Congresistas.
-Programa para los acompa�antes.
-Men�s de las comidas y cenas.
-Precios.

Como hay mucha gente interesada en saber los precios, te adelantar� que el Congreso, llegando el s�bado por la ma�ana y saliendo el l�nes antes de comer, sale por un precio especial de 21.000 pesetas / persona en habitaci�n doble. Para los que vienen solos y no quieran compartir habitaci�n, hay un suplemento de 2.150 pesetas / noche. Para las parejas mejor avenidas tenemos un n�mero limitado de habitaciones con cama de matrimonio, as� que si sois de entre ellas haced la reserva pronto indicandome esta circunstancia.

Para las dudas, consultas y reservas es muy importante que os pongais en contacto conmigo cuanto antes por cualquiera de los m�todos indicados abajo.

Para la gente que no tiene transporte desde su lugar de origen se pueden gestionar huecos en coches de otros asistentes (tambi�n hay que contactar con EA1BK).

Ense�ale a tu XYL el programa para los asistentes, y si sois de buen paladar y mejor comer, no dejeis de leer los men�s que hemos preparado.

Queremos que el Congreso RedURE Zamora'98 tenga un buen nivel t�cnico, pero adem�s que tu y tu pareja os lo paseis lo mejor posible.

No olvides hacer vuestra reserva cuanto antes. Hasta que nos veamos en Zamora:

73 de Al, EA1BK

> on "local 2 meter repeaters".)

Take us back to 1958 and tell us what 2m repeater you operated on. As far as I know, the only rptr on the air in the late 50s was Art Gentry's 2m AM rptr (K6MYK) in Los Angeles.

Let's read a a couple paragraphs from Art's obituary:

ARTHUR M. GENTRY, W6MEP, SK
The ham that gave each and every one of us the ability to communicate over repeaters has died at age 89. Arthur M. Gentry, W6MEP, passed away about three weeks ago in Beaver, Oregon of natural causes. Only a month earlier he and his wife Millie, K6JJN, had moved to Oregon to be with their grandchildren.
It was back in the late 1940's that Art Gentry began experimenting with receiver designs that would permit hearing signals on the same band that a nearby high power transmitter was operating. By the late 1950's he had developed the needed hardware to put the first practical voice repeater into operation from atop Mt. Lee overlooking Los Angeles, California. Gentry's designs were adopted by both the Amateur and Commercial Land Mobile services and lead to a revolution in voice relay communications that prospers to this day...

So tell us Phil, were you in Los Angeles in 1958 operating on Art's 2m AM rptr? If so, what was your W6 call back then?

Otay Jeff, I'm game. Since Rod has urged us to go forth into the 21st Century embracing new technology, when are we going to force the Codeless Technicians away from Two Meters and such four-decade-old technology as repeaters and up into the microwave region?

And the rapid operation of a SPST switch moves us beyond this somehow? I believe this operation was originally used in wireless with spark gaps.

This is the satellite news group. Packet, SSB and some FM, CW are used here. I believe some companded SSB might make RS-15 usable, but I am still working on a external unit for this.

Well, what do you know, a person with nad's from the other side of the debate.

I am impressed! To bad you had to stoop to character assignation right out of the chute. While I do agree with your stance that Tech's spend to much time on two meter FM, I cannot believe you felt your position was so poor that you could not impart any facts pertinent to the situation.

This is the satellite newsgroup. Two meter FM is not really the subject. Some CW is, but not much.

Christopher Cox

BTW, do you know what 16 point QAM is?

Foster,
I am not a ham radio operator -- I found your web site because I am looking for someone to try to find out some information for me regarding conditions in St. Croix, US Virgin Islands. I have friends, family, and property there. The news media has totally discounted the US Virgin Islands and the other Caribbean islands in their news updates regarding the damage done by Hurricane Georges. Could you help me? I am not sure how you guys "surf" the airways, but I would appreciate it if you could indicate to me if you can do this. Thanks for your help.

Regards,

Jana

P.S.
I hope the message you posted regarding FHO Communications works for you -- sounds like a scam artist to me.

Good Luck

2164. Re: 73's to all

Newsgroup: rec.radio.amateur.space
Date: 1998-09-24 00:00:00 UTC
From: Christopher Cox <cobox@netexp.net>
Message-ID: <01bde7be$fc36e360$8860b6cd@cbx-nt>
Source record: 15110

Hi Pieter,

Then you have a pretty good feel for where the Electrical Engineer's point of reference was as he talked to Mr. Stafford. It would seem as the communication industry is milking bandwidth for all its worth, we are debating whether or not A1 operator proficiency should be tested. I actually agree with both camps to some degree, and some middle ground should be struck. It is the extremist who seem to be clueless and lack logic, much less character and backbone.

A1 is great for experimentation, work the world on a couple transistors.

Q-TOR is operable when CW is not.

Amateur Radio is not keeping up with the commercial sector.

We need more experimenters, from the simple to the complex, RF and Digital.

I like playing with Satellites, just a personal preference at this point. It is addictive...:-)

A 'small amount of information', eh? I'll have to check it out. I just
thought that I'd mention my only radio astronomy experience with one of
these things, a 12 foot Luly collapsible dish made of silver-coated fabric.
It was very light and I was able to easily hold it while searching the
sky for one of the few satellites back in 1981. It was a very dark sky on a
beautiful night in rural Oregon. Jupiter was out and when I pointed it
that way the video and audio monitor kind of exploded into lots of white
noise and herringbone patterns. Many other parts of the sky showed
increased noise levels at the 4Ghz spectrum. This was with one of those
old 120 deg. Kelvin LNA's.
I haven't seen any Luly dishes since then but I have heard that the
silver particles all fell off, rendering them unusable. It had a
high F/D ratio, meaning relatively shallow, I think. Many of those
older dishes had lots of strong sidelobes however.

Yes you are right.
If you are a company seeking to launch a 'dummy satellite' then you
use an Ariane-5 ... BUT if you want to launch a real satellite then
you must choose another launch company!!!!!

I read Spacenews Sunday afternoon and it said that RS-13 had been
activated. Sure enough when I monitored the beacon on 29.504 I copied a
CW signal saying it was receiving on 21 and 145 MHz and transmiting on
29 Mhz. I could not hit it with 145 mhz up. I heard a few guys on it using
CW, just wondering what mode it was in? Any info would be appreciated.

2183. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.space
Date: 1998-10-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6v1m7u$525@news.Hawaii.Edu>
Source record: 15129
Cross-posted to: rec.radio.amateur.space,rec.radio.broadcasting,rec.radio.cb

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman (KH2PZ / KH6)

Who built and launched AO-27?

Seems they are better at ham satellites than AMSAt IS WITH p3d.

Should amsat BUILD A 2ND AO-27 so we can get something in the air in 1999?

What would it cost and how long would it take to build a 2nd copy and launch it?

Who built and launched AO-27?

Interferometrics built the parent satellite of which AO-27 is a part:

http://www.interf.com/

With regards to the other question:

Should amsat BUILD A 2ND AO-27 so we can get something in the air 1999?

There was good reason not to, since there was already a project underway, ASUSAT-1, which was due to launch in 1998. I have not seen any changes to their WWW page and when i joined their mailing last, it looks like there hasn't been any traffic on that list in a couple of years. It was to go up about the time that SEDSAT will, and i would presume at this point that the ASUSAT-1 project may be stalled or curtailed?? Does anyone have any information on this?

What would it cost and how long would it take to build a 2nd copy and launch it?

Very little compared to P3D, and launch opportunities are substantially greater. ASUSAT-1 is classed as a nanosat (5kg) and that class should be substantially easy to find a ride for. See:

http://www.ee.surrey.ac.uk/EE/CSER/UOSAT/SSHP/future_nanos.html

Presumably, the development effort at Arizona State should substantially reduce the amount of time to build something of that sorts.

n.b. If it is built, i would hope that the downlink could be horizontally polarized, as then it might be usable with an low-cost antenna at a fixed elevation using an inexpensive rotator. That would get the antenna system cost down below $100 (or less) and be simple enough for use in some of the under-developed countries. If we can come up with new ideas like this to try, then both funding and launch opportunities will be easier to come by.

Only large satellites are stabilized and even then, the orientation
is variable depending on position. Horizontal and vertical polarization
lose their meaning in terms of space communication. You can say "linear
polarization" but which direction it is will vary. Far better would be
if they
used circular polarization. Then you could use a vertical or horizontal
antenna on Earth (albeit with a 3db loss) with no fading due to polarization.
Using your own circular polarized antenna on Earth you recoup the 3db.
Unfortunately, CP antennas are somewhat directional and really
need to be pointed--which is not feasible in a nanosat so...
They will undoubtedly use whips sticking out of various faces of
the satellite and we will suffer polarization fading unless we use
CP antennas here on the ground.

Btw: The RS-12/13 satellite is easy to work with simple (vertical) antennas.
I also use antennas with fixed elevation quite successfully for ham satellites;
there are images of my setup at my web site below.

As for the develop & build, P3D is nearly complete. As for why Amsat doesn't use Orbital Sciences, I think that they feel ARIANESPACE hasn't screwed us enough yet. "If you're gonna get screwed, you might as well get your monies worth."

Hi Bob:

According to Kraus (Radio Astronomy, 1966, p. 329) the flux density from the quiet sun at 150 MHz is approximately 1.e-21 Watts/square meter/Hz, or -180 dBm/Hz for a 1 square meter aperture. This would be about 7 or 8 dB below the receiver noise in a good receiver. The ratio of solar noise to receiver noise can be improved by using a larger aperture (i.e., more antenna gain).

Noise from the disturbed sun can be as much as 30 dB higher than that from the quiet sun but this is highly variable. The sun has been fairly active lately and the general level of activity should continue to increase during the coming year.

Hope this helps.

Yes, its beacon is again perceptable, but it is difficult to get a good signal through it. Wait another month and it should be in better condition for use at apogee.

I've used it wouldout a problem. Been a few weeks since I used it. But
from what I can remeber, you boot to DOS version pressing F8 when the PC
boots and then once you load up the Batch file you then type in WIN at the
DOS prompt and it loads up the needed VXD files.

This is a copy of my batch file I used once I'm in DOS to work in Windows.

```
FLEXNET
IF ERRORLEVEL 1 GOTO :exit
SMSBC /tc:2
IF ERRORLEVEL 1 GOTO :exit
FLEX
IF ERRORLEVEL 1 GOTO :exit
SMAFSK12
IF ERRORLEVEL 1 GOTO :exit
FSET MODE 0 1200
FSET TXDELAY 0 50
SMMIXER /s:line /o:0
GOTO :end
:exit
FLEX /u
:end
```

Follow up to rec.radio.amateur.antenna

Hi,

I am interested in designing Log Periodic Antennas with 8/10 dB gain in the
100/2000 Mhz range.

LP-CAD 2.3 is OK for calculating the elements and the gain.
But it is another story for the impedance....

I yet have been unable to find the formulas for calculating
the impedance of Log Periodic Antennas.

I am thinking of bying an antenna software. (Elnec,Eznec,NECWIN-BASIC or
NECWIN95).
But it seems these softwares are poor with the computing of the feed
line of Log Periodic Antennas.

Any suggestions?

73,

F6BOM

2214. Re: NEC,Cad and Log Periodic Antennas

Newsgroup: rec.radio.amateur.space
Date: 1998-10-08 00:00:00 UTC
From: John Mock <kd6pag@h207-21-75-37.theos-software.com>
Message-ID: <877lyax5xd.fsf@TVR-LINUX.THEOS-Software.Com>
Source record: 15062

I am interested in designing Log Periodic Antennas with 8/10 dB gain in the
100/2000 Mhz range.

Please see attached posting to another list on a similar topic. NEC2 was
claiming comparable gain figures for mine at 70cm, a few dB less for 2m
(but i didn't want that much directivity for the uplink to AO-27, anyway).

LP-CAD 2.3 is OK for calculating the elements and the gain.
But it is another story for the impedance....

As noted below, i found the formulae in the ARRL Antenna Book disappointing.
I ended up running long series of (largely automated) experiments with NEC2
to get the information i was looking for. The "design impedence" seem to
bear little resemblence to the actual simulated impedence, but was at least
a qualitative figure and can at least be an indication of which direction
to make adjustments.

I don't know if that program is based on those design concepts or different
ones, so your results are likely to vary.

I yet have been unable to find the formulas for calculating
the impedance of Log Periodic Antennas.

They are in the Antenna Book and maybe you'll get better results with them
than i did. My empirical simulation results looked plausibly close to what
the MFJ meter gave me (with some minor scaling), so i think i'm at least on
the right track. (And other AO-27 operators give me good signal reports,
also noting significant improvements over earlier antennas).

I am thinking of bying an antenna software. (Elnec,Eznec,NECWIN-BASIC or
NECWIN95).
But it seems these softwares are poor with the computing of the feed
line of Log Periodic Antennas.

Those based on the NEC2 engine can be used with LPDAs and LPVAs, but
don't try to simulate your feed structure. Instead, just describe the
elements and model the feeder as simple transmission lines ("TL" under
NEC2). As noted above, i got pretty good agreement with my actual antenna
by using that (and it's only the second computer-aided antenna design i've
done [with almost everything else before that being miserable failures]).
I'm not so sure how well those based on MININEC will do on this problem,
though; someone else will need to asnswer that one.

I can't really help you with software selection as, other than the NEC2
FORTRAN core, everything else i'm using is homebrew (mostly in PERL).
Almost everyone uses some kind of front-end to NEC2 or equivalent, so

choose one that matches your operating style. (That is, unless you're
a Quarter Century computer professional who still enjoys manipulating
the on-line equivalent of decks of punched cards and staring at line
printer listings on a CRT...) In the absence of better recommedations,
i don't think you'll go wrong by getting something from Roy Lewallen
<w7el@teleport.com>, such as EZNEC or ELNEC:

http://www.teleport.com/~w7el/

That's reasonably mature software and is likely to be actively maintained.
Supported software is definitely worth paying for.

73's and good luck!

-- KD6PAG (Networking Old-Timer, RF newbie)

P.S. At this point, i can't keep up with 'rec.radio.amateur.antenna' but
i do read 'r.r.a.space' regularly.

One of the regulars on the Amsat 2m net, Roy G8GMT, asked for advice
on log periodic antennas for analogue satellite working AO27,FO20,FO29
He is considering a linear polarised log periodic that covers 2m and 70cms
in one antenna.

Non[e] of us on the net have used this type of antenna. Has anyone got any
advice, or hints and tips I can pass on.
[John G7HIA]

That's what i use. Actually, it's an LPVA, and some of the design concepts
are written up in the current ARRL Antenna Book. But they talk about an
LPVA as an HF antenna, and as such, SWR is not nearly so critical as it is

at VHF and above. So i'm not sure i agree with their formulas entirely and did alot of "cut and try" with NEC2 to come up with what i'm using. But mine worked out to be pretty close to 50 ohms direct feed, and without a diplexer. I'm still working on refining the design and making sure that it is reproducible (in currently operating AO-27 with the second prototype and will be using it for terrestrial purposes for a net tonight, as well).

A few months ago, I designed and built a 130/1300 MHz log periodic antenna. Its a 23 elements, horizontally polarized, 2m boom antenna. It works pretty well on all the analog LEOs for elevations lower than 40 degrees.
[Jean-Louis G/F6AGR]

Mine is only four elements and just covers 2 meters and 70 cm. I'm hoping to pick up 1.2G in a future revision, but that'll probably mean six elements and alot more experimentation. The problem i see with a broadbanded approach is that, in urbanized areas, one may pick up alot of very high power signals that are already pretty close to the amateur bands. By having the antenna performance drop off rapidly away from satellite sub-band means that the front-end requirements are not quite as stringent.

73's and good luck!

2215. Can AMSAT get a ride on Zenit 3 SL???

Newsgroup: rec.radio.amateur.space
Date: 1998-10-08 00:00:00 UTC
From: wb4lnm@aol.com
Message-ID: <19981008164631.02560.00011532@ng92.aol.com>
Source record: 15063

News release out yesterday indicates "...Sea Launch said Tuesday that it will send up its first Zenit-3SL without a payload to demonstrate the rocket's safety", [from the Boeing Sea-Launch platform].

Gee, sounds like a free ride possibility to me.

How 'bout it AMSAT Management, has this been discussed with Boeing? Here's a $50M launch going up without any paying payload. Sure sounds like good PR if they could loft an international amateur spacecraft into orbit instead of a block of cement.

There's also TMSAT-1, which is capable of both 9.6Kb and 38.4Kb operation. As i understand it, the 38.4Kb is a wide-band version of the G3RUH modem, and there are other spacecraft planned to use that encoding scheme. There's no reason that i can think of (other than band-planning) not to use this at 70cm and above.

I'm very pleased with PE1JPD web pages (http://www.dutch.nl/bdj/index.htm), and look forward to seeing more. It looks like they might be similar, if not compatable to, TMSAT-1, albeit in a different band.

If anyone in the S.F. Bay Area has an interest in pursuing this kind of approach to packet, please send e-mail!

2217. John Glenn versus P3D

Newsgroup: rec.radio.amateur.space
Date: 1998-10-08 00:00:00 UTC
From: Ian Cummings <cummings@neca.com>
Message-ID: <6vjpa2$5om$1@taurus.neca.com>
Source record: 15065

Hi,

John Glenn and two support physicians plus experimental
equipment are being blasted into space for $10,000 per kilogram.

Does anyone else have doubts about how valuable the research
on one aging politician-astronaut's inner ear and bone density will
be?? Seems very "made to fit" to justify his return to space.

Could P3D be launched from a shuttle or is the kick motor incompatible?
If it could be, it would seem a far more valuable and noble endeavor.

Anyone else feel this way??

Ian KB1SG

If P3D can not fit, maybe we would have time to build another smaller
satellite like another AO-27 ??? When is the launch date?

The only tricky part I found was that I had to add...

set blaster=a220 i10 d1

... to the script (before "smsbc")

```
rem lh?
FLEXNET
rem loads the FlexNet Kernel module
IF ERRORLEVEL 1 GOTO :exit
set blaster=a220 i10 d1
SMSBC
rem /tc:1
rem loads the SoundBlaster driver, PTT output: COM1
IF ERRORLEVEL 1 GOTO :exit
FLEX
rem activates the FlexNet Kernel
IF ERRORLEVEL 1 GOTO :exit
SMAFSK12
rem loads the 1200 Baud AFSK modem
IF ERRORLEVEL 1 GOTO :exit
FSET MODE 0 1200
rem sets the SBC driver to AFSK 1200 Baud
SMMIXER /s:line /o:0
rem sets the output level to maximum and input to line
GOTO :end
:exit
FLEX /u
rem unloads FlexNet in case anything went wrong
```

I wonder is this is why I am having problems. Flexnet seems to recognize
the Soundblaster (AWE64) okay, but the soundcard diagnostic program gets an
internal error. I'm running from DOS, but I'll try this tonight.

What terminal program is everyone using? Is BayCom (bct.exe) the way to go? Is
there anything more simple?

P3D can not ride on a shuttle because of the danger to the shuttle
from the fuel aboard P3D.

Shuttle orbit is also too low for P3D. But I do believe that AMSAT
should design and build a ham satellite that could be launched from
the new space station.

Glenn looks like he gets a ride because of a pay off from Clinton for
Glenn's stonewalling for him in the Senate hearings against Clinton.

Shuttle's parking orbit isn't nearly high enough. The P3D kick motor
wouldn't have enough delta-v to get it to the right molynia orbit.

The modem PE1JPD uses is not compatible with the G3RUH modem.
It is a design by Matjaz S53MV, and it uses manchester encoding.

The advantage is that it does not require low-frequency response in
the transmitter and receiver, which often is a problem when using G3RUH
type modems with commercial transmitters. The disadvantage is that it
requires twice as much bandwidth as a G3RUH modem at the same datarate,
thus requires more power to get the same bit error rate.

I would say that when one is designing a custom trx anyway, it is better
to go for the G3RUH modem type. When using existing commercial equipment,
the S53MV modem is better. But of course there is no commercial equipment
that has the required bandwidth for this modem at 38400 bps.

Speeded-up G3RUH modems are available from several (mostly German) sources,
it would be a nice experiment to try them with PE1JPD's transceiver.
(at 76800 bps, of course)

How similar is this vehicle to the one that destroyed 12 Globalstar
satellites last month? I read where the Russians offered Globalstar a
free ride worth $30M if the next Zenit blows up. "Uh, gee, no thanks!",
was the reply. AMSAT could use such guarantees, eh?

Meanwhile I have converted all of my circular yagis to twin horizontally
phased arrays for terrestrial work. Oh well.

Could P3D be launched from a shuttle or is the kick motor incompatible?
If it could be, it would seem a far more valuable and noble endeavor.

First, P3D needs a geosync. transfer orbit. Second, as has been discussed
here on numerous occasions, anything launched via the Space Shuttle will
have a short lifetime. The orbit isn't very high, and the satellite can't
contain any nasty chemicals or otherwise be a risk to crew or cargo. So
no conventional propulsion systems allowed. And furthermore, P3D is pretty
heavy compared to what usually 'goes along for the ride' on the Shuttle,
or on anything else, for that matter. Sorry.

-- KD6PAG ('Networking Old-Timer, RF newbie')

P.S. My feelng is that if Sen. Glenn makes even a non-trivial difference
in NASA (or other space-related) funding, then from NASA's standpoint,
the ride is cheap. If it captures the attention of school kids and they
decide to steer their career towards space instead of (for example) the
stock market, then that makes a difference, too. Or bring pressure on
Congress to better fund space exploration. But, REALLY, i'd much rather
discuss what we can get into orbit and leave the politics to the realm
of politicians and concerned citizens. (And i say that as someone who's
been mentioned in the local newspaper more times than i could keep track
of, as a concerned citizen in years past.)

As others have mentioned, not only would P3D not make it
past Shuttle safety requirements, it wouldn't have enough
delta V to get from the Shuttle's orbit to anything resembling
its baseline orbit. I would also wonder about the launch
cost, timeframe, and so on - holding on and waiting for
ESA/Arianespace still looks like an option to me.

If people think the answer is something smaller, how about it?
Cheap launches for little payloads aren't that hard to come
by (Get Away Special, anybody?).

If you have an idea for a satellite, by all means, please
develop it. The amateur satellite program itself started
with people wondering if certain things might be possible...

Space Bulletin 012 ARLS012
From ARRL Headquarters
Newington, CT October 9, 1998
To all radio amateurs

SB SPACE ARL ARLS012
ARLS012 Bill Tynan, W3XO, to Step Down as AMSAT-NA President

AMSAT-NA President Bill Tynan, W3XO, will formally announce his retirement from office during the AMSAT-NA 16th Annual Meeting and Space Symposium October 15-19 in Vicksburg, Mississippi. An announcement also will appear in the next issue of The AMSAT Journal. Tynan, who turns 72 on Columbus Day, helped found AMSAT-NA in 1969 and has headed the organization for the past seven years. ''I think it's time,'' he said, although he expressed regret that he did not get to see the Phase 3D Amateur Radio satellite get into orbit during his tenure.

Tynan said he'll recommend to the AMSAT-NA Board of Directors that Executive Vice President Keith Baker, KB1SF, be appointed to replace him. ''He knows the organization, he's been my right hand,'' said Tynan. He said he plans to continue serving on the AMSAT-NA Board at least until his term expires next year and intends to remain active in AMSAT.

Tynan said the outpouring of support for the Phase 3D project was the highlight of his time in office. ''The support of both the League and all our members to get where we are is the most gratifying and significant accomplishment,'' he said. Tynan noted that the Phase 3D satellite is completed and will undergo some final testing this month in the Washington, DC, area. However, he said there was ''nothing new at all'' to report on the possibility of a Phase 3D launch opportunity. Tynan said he'll be among those keeping a close eye on the European Space Agency's Ariane 503 test launch set for October 20. ''One of our primary hopes is for an Ariane 5 launch,'' he said. Tynan said he's optimistic about the future of Amateur Radio in space.

Licensed since 1945, Tynan edited the ''Above 50 MHz'' column in QST from 1975 until 1992. In 1988, he retired as senior engineer from

the Johns Hopkins Applied Physics Lab. In 1996, he was honored as the Dayton Hamvention's Amateur of the Year.

Tynan remains active mostly on the VHF and UHF bands. Once he's free of the day-to-day affairs of AMSAT, he said he hopes to spend more time on the air, especially on 6 meters.

Excuse me, but how is that satellite going to end up at the space
station ? Is it going to be built at the space station from raw
materials freely available in orbit ?

It makes no sense to add all the overhead to first send the satellite
to the space station and then launch it from there. Much less
resources are required by directly launching it by an expendable
rocket from the ground.

Wasn't that idea scrapped long ago?
Who wants to build a satellite that conforms to the very strict
specs for launch as a GAS and then have it in such a useless orbit
as the shuttle would put it in?

Radio Meteor Observation Bulletin No. 62 October 1998

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Barcelona, Spain (01 59' E, 41 21' N)
Frequency: 48.250 MHz
Transmitter location: most likely Czech television C2 C. Budejovica,
100 kW, horizontal polarisation.
Antenna: 6-element Yagi 617-6B, 14 dBd gain.
astronomical azimuth 215 deg (=NE), elevation 0 deg.
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (100 Hz) and fed into the PC in real time.
Data sampling system: using a super 14 bits A/D card to PC/XT and
"Data Capture" software with 9 second/18 sampling interval to
store all the > 1.0 s signal increases.

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 deg (= E),
elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB.
SWR of antenna alone at 66.5 MHz: 1.4/1 (good to very good),
measured with MFJ/259P SWR analyzer (HF-VHF 1.8 MHz to 170 MHz)
on Sep 28, 1998.
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

September 1998

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

Notes:
. ? probably affected by sporadic-E, direct reception.
. local time = UT + 2 hours.
. * warning for relative high number of long duration reflections,
an indication for potential stream activity.
. % test with different antenna amplifier, not successful.

Maurice De Meyere

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 20 deg
Antenna amplifier: 10 dB gain
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

Will Kelsey

Observer: Werfried Kuneth
Location: Ferndorf, Austria (13 37' E, 46 45' N)
Antenna: 2 element Yagi, direction southeast, no elevation at 1m height.
Receiver: IC-706 at 53.76060 MHz, CW-R mode, 500 Hz CW filter, fast AGC.
Transmitters: 1) 30 kW TV video carrier from Bari, Italy, distance 700 km,
direction south and 2) a 30 kW TV video carrier from Sicilia,
Italy, distance 900 km, south. The total echo power of both

transmitters is processed into same 40 Hz virtual
receiver channel.
Observing method: automatic setup using FFTDSP42t software by AF9Y to record
the audio signal. 20 channels of 2 Hz width are used for meteor
identification, pictures with interference, sporadic-E, E-layer
and FAI propagation are manually rejected. Sampling interval: one
4096 point FFT every 0.5 seconds.

The meteor counts below are corrected for a full hour observing time. If
the recording duration is 20-40 minutes, a dot is shown after the value, to
show the reduced accuracy. Results for less than 20 min. observing time are
excluded.

Counts of reflections longer than 3.5 seconds

How much would it cost to build?
How long would it last ... 1-2 years?
If so why not do it?
Nothing says that we can just build a complex satellite!!!

No. I do not feel this way. Research is very important, and much important research has been done from space. The aging should, as others already have, have the opportunity to benefit from space based research. Remember, we will all reach that point sometime in our lives!

Amsat *IS* building a ham station for the new space station. Just because it remains attached to the station doesn't mean it isn't a satelite. The ham station will have a modular design so that different ham groups in different countries will be able to build modules to plug into the ham station rack. There might also be opportunities to mount amateur payloads on the outside station truss. There should be plenty of opportunities for amateur payloads during the life of the space station.

I will refer you to the STS-95 press kit. John Glenn's flight will be ejecting PANSAT (Petite Amateur Naval Satellite) from a GAS canister. It was built by the Naval Postgraduate School and will serve as a digital store and forward satellite using spread spectrum on the ham bands. Those amateurs who equip themselves with spread spectrum gear should be able to use it. It should stay up for a year or two before it burns up. This project was the subject of a presentation at the Amsat annual meeting several years ago.

A few months, actually. Look at other things that were thrown out
of a shuttle without own propulsion.

And often it will be in a 28-deg inclination orbit that it useless
for large parts of the world (at that altitude). Over here in Europe
we would rarely see it. So why would we spend effort on it?
That cuts down the number of people prepared to build it.

Rob

Will it stay up as long as a year? In that orbit, with that sectional density?

Nobody wants to see another AMASAT in orbit more than I do but I do believe there are more important issues at hand. We(americans) need to determine how the lack of gravity effects are innermost biological systems. It is hard to do on a young person because their bodies will compensate better than an older persons. Frankly, we need research what will better man-kind, not indulge or hobbies. Also, I have noticed that many people feel that any launch seems to be a possible launch for the P3D. This thing was expensive and its host should not be considered lightly. We need the right host, otherwise the satellite is as good as on the ground!

Is anyone making a modem kit for Pansat yet? This is happening pretty
soon right? I assume 'being equipped for SS' isn't something that we
can just do, without very detailed knowledge about how this thing
works.

So we AMSAT can build a repeater like P3D to ride on the space
station?

SO Why didn't AMSAT build it???
Sounds to me to be something AMSAT should be doing, if only as a
partner with another ham satellite group. Sure seems like a way for us
to pay for our "clean room facility".

Why launch it? Why not just bolt it onto the nice stable platform? No need for any attitude control. Modular construction to permit replacement of faulty units. Cheaper and lighter without the ABM.

Source record: 15000

Hello! In order to use the Icom CT-16 Satellite Interface box with the 271H/471H combo, is it necessary to have the UX-14 level converters installed in both rigs? I don't plan any computer control of the radios, but I would like to be able to slave one to the other for easier tracking. Since the UX-14 interfaces are seemingly non-existent these days, I don't want to buy a CT-16 and not be able to use it.

Thanks for any input,

Paul WD8DKY

Thanks to all for the info I received via the NG or e-mail

I have ordered the latest edition of ARRL Antenna book .

"Antennes Larges Bandes du Prof. Dubost &Zigler (Rennes)" have been one of my favorite, so it is a small world and there are not many books on the subject.

I downloaded NEC2d and I have started using it. It is easy because LPCAD can save a design as a .nec file ready for NEC2.

I think I will by NEC-WIN basic to preserve the compatibility with nec files.

With some designs LPCAD sends a warning message asking to see more info in:

IEEE Trans. Antennas and Prop. Vol AP-34, No 12, Dec 1986 pp. 1404-1410

AS a live 400km from Paris now, I dont know how to get a copy of this paper.

Thanks and 73,

F6BOM

The soundcard driver is meant to be run under Win95. They must be loaded
under DOS, but it uses the VxD's for 95. I was trying to use an older computer
with Win3.1. I'll have to try this when I upgrade my computer.

But there is...
What you need and what is available depends on the satellite you are
looking at. There are a few different "standards" in use, and AMSAT
organisations have some decoding software available.

And of course they have the specs, so you can write your own.

OF course a repeater is not very useful in an orbit like the space
station has... you would want a store-and-forward system like the
pacsats in such an orbit.

Message-ID: <87n2718y5n.fsf_-_@TVR-LINUX.THEOS-Software.Com>
Source record: 15007

There was good reason not to, since there was already a project underway,
ASUSAT-1, which was due to launch in 1998. I have not seen any changes
to their WWW page and when i joined their mailing last, it looks like
there hasn't been any traffic on that list in a couple of years. It was
to go up about the time that SEDSAT will, and i would presume at this
point that the ASUSAT-1 project may be stalled or curtailed?? Does anyone
have any information on this?
[Previous posting]

I don't know if it will be posted here, but i've since heard that some
kind of status report is expected soon on ASUSAT-1. So we shall see
what time scale things will happen on. But i do think that there is
enough demand on AO-27 to support more than one new J-FM bird, given
that there are alot of satellite ops who are reluctant to do skeds on
AO-27 because it's so crowded (on weekends, at least).

The only problem is to find a nice stable platform that others allow
you to bold something onto.

A space station is not so nice because space stations tend to be in orbits
too low to be interesting.
I believe that plans once existed to create platforms at geostationary
positions, but apparently they have been abandoned.
One could try to get some amateur equipment included in a commercial
satellite to be launched to geostationary position, just as it was done
in other orbits on Russian satellites.

Source record: 15010

Clearly, the shuttle may not be the best launch platform for
P3D.

As a physician and as someone who has spent my time in
research settings (earned Ph.D. years ago at the bench), I
can assure you that Glenn's "research" is highly unlikely to
yield anything that I will be using at the bedside.

Research on one subject is very unlikely to lead to any conclusions
that can be extrapolated to all patients and furthermore the
mechanisms causing space related vestibular problems and
bone loss are entirely distinct from the causes of such problems
on earth. The Federation of American Scientists (FAS) has also
been speaking out on the Glenn research.

As for me, I would rather the NASA budget be used more appropriately
independent of P3D issues (although, the $$ spent on Glenn could
be used for a number of more worthy launch projects other than the
shuttle and some of which might be useful for P3D such as the stuff
they launch from Vandenberg). I'm no expert on launching stuff into
space but it's all $$ per kg and each kg that we spend tax dollars for
should be well placed...

In any event I hope we see P3D successfully launched.

2260. MFJ 1278T for digital satellite work?

Newsgroup: rec.radio.amateur.space
Date: 1998-10-12 00:00:00 UTC
From: "Greg D." <gregd@jps.net>
Message-ID: <3622F329.7309@jps.net>
Source record: 15011

Hi,

I recently picked up an MFJ 1278T TNC with Ver 3.4 firmware at a ham swap. It has internal 1200 and 2400 bps modems, both configured for for AFSK. The manual (ca 1991) notes the existence of AO-10, but for CW. No mention of the PACSATs, presumably because they hadn't been launched yet...

Are there mods to be able to use the TNC for PACSAT (1200 baud) satellite work, or a recommendation for an external modem for 9600 (and how to hook it in)?

Thanks,

Greg.

The irony, of course, is that they canned one of their most experienced
shuttle pilots because he was too old.

The real question is ... who would see it?
For how long?

I believe AMSAT should have at least a three tier development plan for ham satellites.

1) Small easy to build systems that cost less to build [hopefully $50,000] within one year and launch [within two years max] that have at least a two year life.

2) Medium satellites that cost $50-250,000 to build [within 2 years] and launch [within 2-3 years] and that last at least 3-5 years.

3) Complex satellites like P3D that cost more than $250,000 to build [2-3 years] and launch [with 3-5 years] and have a useful life of 5-15 years.

I do not know if I can agree with the statement that there are many more qualified people other than Glenn. Remember Glen, at one time was, one of the most qualified astronauts. He is a Senator because of that, not the other way around! I do think that a Senator in space is unusual and should be looked at with some cynicism. Moreover, I do not think Clinton is using it to pay him off. Senator Glenn in space is a lot more interesting and a lot more positive than the other Washington issues of late!

Hi! The '471H covers 430-450 MHz, all-mode, w/ 75W power out. It has 32 memories and CTCSS encode built-in as well. It runs from 12VDC (no AC supply built-in).

The radio works perfectly, and is a cosmetic 9/10. I have the box, manual, power cord, and hand mic for it as well.

$500 (no trades, please), and I'll meet you in the Woodridge/Arlington Heights, IL area for the swap if you're local. Otherwise, buyer pays shipping.

Please drop me a note if interested.

Pretty much the same. I'm not suggesting that we risk the big Phase III bird, but there must be something that we could put together that would be worth riding free. Even if it had triple systems, I don't think we'd be talking anything that would tax this launch vehicle. So who cares if it only lasted 3 or 4 months? At least we would have something to use, which is more than we have now.

Why did it run out of hydraulic fluid? Did somebody forget to 'top it off'?
The only info I could find about the Globalstar pyrotechnics is that they
knew what went wrong so there won't have to be a big investigation.

There has to be a lot of capacity with these Zenit vehicles to hold
12 commercial satellites. I suppose there is room for just about anything.
But why would you be satisfied with something that only stayed up 3 or 4
months? If I may, it seems that we only have one bird left right now,
and its not supposed to still be up. Only by chance is it up and working
(sometimes). It looks to me like the hamsat age peaked in 1995. Don't
we need to think more long term, with more cautious future expectations?

I have seen film "Contact" based upon the novel by Carl Sagan. in
start of film main character radioastronomer Ellie Arroway as girl is
using a transceiver y calling with callsign "W9GFO" well now I know
callsign of Grote Reber the first radioastronomer was W9GFZ. There is
any relation between the callsign W9GFO of film and W9GFZ in honor of
Grote Reber or is only mere causality?

>

Are you answering your own question?

The scoop I got was there was an flight anomaly that was attempting to push the bird off course. The gimbaled motors continued to correct which would have been fine, but the hydraulic design does not recycle the control fluid, it throws it away (weight savings). Well, the hydraulic reservoirs where not loaded up with this amount of correction in mind, so it ran out.

Of course the question becomes one of what was pushing the bird off, but according to your information they have found the bug.

I meant DX as in distant. It certainly will be distant, to the tune of several
hundered
miles. This is DX for SHF.

Manuel,

The call in the movie originally *was* to be W9GFZ, in honor of Grote,
but got changed to W9GFO somehwere in scripting.

I have found that Grote is still alive, living in Tasmania, but I don't think
he is active in amateur radio any longer. Perhaps some of our VK7 friends
would know for sure?

Grote Reber is a man, a radio amateur who in the 1930's invented
radioastronomy in his back yard in Illinois.

The callsign used in the movie is a "mini-tribute" to him, but the
female character played by Ms. Foster is not based on him.

He built the world's first radio telescope (a 31 foot tiltable paraboloid) in
his backyard in Wheaton, Illinois in 1937.

From 1947 to 1951, Reber was employed at the National Bureau of Standards,
but beginning 1951, he became self-employed with his research in Hawaii and
Tasmania, Australia being supported by the Research Corporation. His interests
included mapping of the background radiation at 1-2 MHz, Cosmic Ray
studies, dating of Aboriginal sites, and botanical studies.

He received an honorary Sc.D. degree from Ohio State University in 1962, the
Bruce Medal of the Astronomical Society of the Pacific in 1962, and the
Jackson-Gwilt Medal of the Royal Astronomical Society in 1983.

Grote Reber is still around and lives in Bothwell which is about 20 minutes
drive from where I live in Hobart. Some of my friends are radio amateurs and
have had no contact with him as far as I know.

The coverage of such a satellite is about the same as the range of a
good 2M Tropo-DX station. The only difference is that with the satellite
you can work the DX at a predetermined moment, and the Tropo station has
to patiently wait for the right propagation.

2286. FT-726R vs. Icom IC820H?

Newsgroup: rec.radio.amateur.space
Date: 1998-10-15 00:00:00 UTC
From: Paul Knight <paul.knight@prairiecomm.com>
Message-ID: <70549j$1vn$1@eve.enteract.com>
Source record: 15035

Hello! I'd like to solicit opinions on which rig would be better suited for a beginning satellite op? I don't have any interest in digital (i.e., packet) operation, just CW/voice, so problems with packet operation are a lower priority to me.

I know I'm comparing very old to relatively new, but the '726 has a solid reputation, and I'd like to learn how it stands vs. the newer rigs.

Thanks for any inputs,

Paul WD8DKY

Interesting. Today's news feed says that the Ukranian investigators found "no flaws" in the Zenit 2 after reviewing the construction documents. They are pointing to an on-board computer as the potential fault. Maybe this is the one that controls the hydraulic fluid.

Back to the original thread that I started, Sea Launch also said today that the demo launch would carry a dummy load of the same physical characteristics as the Hughes HS702 satellite. That is a LOT of volume and weight. We could almost launch car batteries to power a hamsat (just kidding - I know the environment would not sustain them) to get SOMETHING in orbit that works. The launch is scheduled for March of 1999. That's five months to cobble something together.

I've still not seen a reply from our AMSAT management if they have been discussing this with Sea Launch.

I'm a newbie who knows zilch about radio communications (although I am learning!) and alot about computers. So the Winradio 1500i caught my eye. I'm looking to build a setup to monitor solar activity and meteor showers as a stepping stone to more advanced areas in a few years. Has anyone used it? Any advice or stories on it?

Specs on it can be found at this URL (I am no way affiliated with them).. http://winradio.net/home/1500i-s.htm

During filming at the VLA, I pointed out to the Script Supervisor
that W9GFO was only one character away from being an historic
callsign. She listened with interest and made a note, but it
did not get changed.

There is more information about early radio astronomy, Grote Reber
and W9GFZ at:

2291. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.space
Date: 1998-10-16 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <706e3a$p0d@news.Hawaii.Edu>
Source record: 15040
Cross-posted to: rec.radio.amateur.space,rec.answers,news.answers

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Thanks. I hope to do solar and meteor observations at first. And then
maybe Jupiter but I realize it may be beyond the WinRadio's sensitivity.
It will be quite a test! So I am looking for all sorts of freqs. In fact,
I was dissapointed that the WinRadio doesn't go lower as I'm interested in
VLF solar flare and natural earth observing. I may build a separate one
for that.
I went ahead and ordered the 1500. What antenna have you been using on
it?

SB SPACE ARL ARLS013
ARLS013 Phase 3D satellite to undergo testing

Amateur Radio's Phase 3D spacecraft will undergo pre-launch testing this month to analyze the satellite's ability to withstand the harsh environment of space. Thermal-vacuum testing is set to begin October 20 at Orbital Sciences Corporation in Germantown, Maryland.

The spacecraft was transported by truck from the Phase 3D Integration Lab in Orlando. AMSAT-NA Executive Vice President Keith Baker, KB1SF, says the satellite will be placed in a large chamber for the thermal-vacuum test, and most of the air will be removed. ''Then the temperature will be cycled up and down to simulate the harsh heating and cooling environment that the satellite is expected to encounter while in space,'' he said. A complete thermal cycle runs about 36 hours. The Phase 3D satellite will endure five cycles.

Barring unforeseen problems with the thermal-vacuum test, Baker said, the satellite now is slated to undergo vibration testing to simulate the launcher environment either late this year or early next year.

While the satellite was in town, Maryland-DC AMSAT Coordinator Pat Kilroy, WD8LAQ, has been arranging opportunities for AMSAT members and supporters to view the spacecraft before it enters the test chamber.

For more information on Phase 3D, see the Phase 3D Spacecraft Integration Laboratory Web site, http://www.magicnet.net/~phase3d/.

This all rings very true to me, except for the bit about the 31 foot paraboloid. I attended a presentation some years ago at the National Radio Astronomical Observatory, where they showed pictures and video of a reconstruction of the original antenna. As I recall, it was called something like a "Z Curtain", and was a rectangular zig-zag affair. The vertical parts of the zig-zag were the radiating phased array elements, and the horizontal parts performed the phasing function. He had it set up on a circular track so that the whole thing could be rotated.

Am I confusing Grote Reber's antenna with something that came later (or earlier)?

2299. RS-12

Newsgroup: rec.radio.amateur.space
Date: 1998-10-19 00:00:00 UTC
From: Hexe <Hexchen@Bigfoot.de>
Message-ID: <70g7b1$qa4$1@wall.tli.de>
Source record: 14949

Hello !

I monitored the telemetrie-data of RS-12
on monday, 19. oct. 1998, at 1502 utc.
Beacon was loud and clear, transponder
was off, nothing heard.

Power supply voltage 20,25 V
Power 2mtr TX 0,8 W
Power 10mtr TX 0 W
15mtr uplink off
2mtr RX off
Temperature 10mtr TX 17 C
Temperature 2mtr TX 19 C
Temperature power supply 29 C

After that, the operation of RS-12/13
seems to have at least some problems,
worst case the operation may be
cancelled.

Does anyone have more infos ????

2300. AO-27 with an HT question

Newsgroup: rec.radio.amateur.space
Date: 1998-10-19 00:00:00 UTC
From: Tom@astro.net
Message-ID: <70g9b1$4mf$1@supernews.com>
Source record: 14950

Is anyone using an Icom IC-W32A for AO-27?
I'm considering getting one (with a better telescopeing antenna)
so I can try working the sat.

From what I've read about the HT it should work fine, the price is right also!

If your using an HT for AO-27, which one?

All comments welcome.

Is anyone using an Icom IC-W32A for AO-27?
I'm considering getting one (with a better telescopeing antenna)
so I can try working the sat.

As a dry run before demoing a homebrew satellite antenna for the NORCAL QRP
club a few months ago, we tried it with the W32A. It worked just great.

From what I've read about the HT it should work fine, the price is right also!

If your using an HT for AO-27, which one?

I use an Alinco DJ-G5TH and have worked AO-27 with a long super-flex
rubber duck using a chain link fence as a reflector (NOT recommended for
novices[!] or in high RF areas). It also has an AM mode, and i've even
somehow managed to copy callsigns from RS-12 with it (SSB), just for fun.
My friend says his W32A is prone to intermod (especially when connected
to gain omni antennas). The DJ-G5TH has an switchable receive attenuator
for use in urbanized area, which has solved that problem very effectively
during the few times in the S.F. Bay Area that i've needed to use it.
That i rarely need to use it speaks well of that rig.

Especially with the Alinco, get a super-flex rubber duck and leave the
stock antenna in your pack or glove compartment as a spare. With either
rig, the BNC is a weak point. I had to return an ICOM W2A [predescessor
to the W32A] for repair, due to a stress-fractured ground lead on the
BNC. It'll be more comfortable to wear, and you can stuff it in a pack
without having to worry about either the antenna or the BNC.

All comments welcome.

If you live in/near an urbanized area, i would suggest giving the Alinco
serious consideration. Both will work well with an antenna similar to
the Arrow 146/437 hand-held yagi on AO-27 (or ASUSAT-1 if/when it launches).
I told that the Yaesu FT-51 is also a good rig for such areas (but do note
that the FT-50 won't do it for AO-27, as you need simulataneous transmit
and receive to know if you're getting into the bird properly).

With either rig and a comparable antenna, it should work great on most
weekday passes, but it can be a challenge to make contacts on weekend
and/or transcontinental passes.

Whatever you get, make sure that you can at least copy callsigns before
transmitting to AO-27 or you'll just be causing QRM. We had someone on
Sunday calling CQ HF-style who couldn't hear anything, and that trashed
most of the best pass of the weekend for this coast.

And get an Arrow with a diplexer; they'll install it in the handle for you if you order both directly from Arrow Antenna. That's what the serious satellite operators use on AO-27.

Im trying to run a Kansas City Tracker with Win NT using Nova for Windows. When I configure it in Nova for the KCT I get a WINRT error and something about I/O, Memory, IRQ conflicts. The KCT only uses 4 I/O addresses. I checked these in Win NT and they are not being used. Do I need a driver for the KCT??? I checked the dip switches on the card they are set to the correct addresses. Any Ideas Thanks

Your description seems to refer to Karl Jansky's antenna from 1932 in
Holmdel, New Jersey. See any history of radio astronomy for details.

Hello Tom,

I have been using the Yaesu FT-50 with the MFJ-1717 Rubberduck antenna. I have about 80 contacts since May of this year, been able to get into Utah, Idaho, New Mexico and California from here on the East Coast in Maryland. I have heard a couple of times stations in England and Guadeloupe but have not had a good QSO with them. Alot of operators are using the handheld Arrow antenna which works alot better with a HT.

You may want to consider a different brand radio. The Icom and Kenwoods HTs don't transmit below 440 Mhz.

Of course you cannot do any I/O in a user program under NT and you will
therefore need a driver.

The radio doesn't have to. The transmit is on 2m , downlink on 70cm.

The current crew doesn't seem to care much about talking on the radio. The packet station IS on however, 145.985 over the U.S. The digi is currently off. When the digi is on I understand UNPROTO mode is the mode to use to make contacts. It works really well too.

73,
Tom

So what?

AO-27 listens on 2m [uplink] and 70 cm [downlink].

You may want to consider a different brand radio. The Icom and Kenwoods HTs don't transmit below 440 Mhz.

Yeah, i went through this with the Icom W2A with AO-21 [SK]. You can't mod it just to work in the satellite sub-band, you have to open it up completely and i'm too clumsy for that. The Alinco has the same problem, but if you put out-of-band channels in memory, you can specify a different transmit frequency, so you can arrange it to be alot harder to transmit out-of-band by mistake.

Then again, you don't need to tx on 70cm to work ao-27.

That's correct, AO-27 and everything currently being proposed along these lines is mode J-FM (2m uplink, 70cm downlink). You do need 70cm TX to work the MIR/SAFEX Repeater, whose operation has only been sporadic at best in the past six months. I don't know what the plans are for FM transponders (if any) for ISS, currently sked'ed for year 2000.

I understand that and I was not implying that you couldn't work AO-27 with one. But you won't be able to work the Mir repeater with one. And you won't be able to work and future 430MHz uplinks either. For about the same money, one might as well get a radio that transmits down there. No harm there.

Hi There.

I am looking to make up a simple crossed dipole antenna for monitoring
137 mhz weather sattelites.
What I want to know is what determines the polarisation of this
antenna..? I understand that only the vertical component is circular but
is it LHC or RHC and how can it be changed (IF?).

Cheers.....
73,s Keith.

I've been listening on the 10-meter beacon frequency for RS-12. I haven't heard a thing. Is my tracking software bad or has something happened to RS-12? Many thanks & sorry if this question has been asked before. If RS-12 isn't working, are there any other HF up/HF down birds up there for amateur use? I only have an HF rig, so my satellite operation is thus very limited! 73 & thanks to all.

The two dipoles are fed 90 degrees out of phase by using a 1/4 wave (electrically) piece of coax between them. Polarization is determined by whether the next element to receive signal is clockwise or counter-clockwise from the first, viewed from the rear.

Say dipole one is oriented from 12 o'clock to 6 o'clock, and dipole two is 9 o'clock - 3 o'clock. If the center conductor of the feedline connects to the 12 o'clock element, and the center conductor of the 1/4 wave phasing line connects to the 3 o'clock element, then you have RHCP. If, on the other hand, the center conductor of the phasing line is connected to the 9 o'clock element, you have LHCP.

Hope this clears it up. If not, I can probably whip up a picture for you.......

Manual,

I am deciding what interface to use for my station and I too am using NOVA... I am very close to ordering a the SASI interface from NLS, for sale by same folks that bring us nova so it should work pretty good. Also, it will plug into the parallel port and that will allow use of a laptop for field day, surely a plus. Most people I talked to are using Kansas City Tracker forsale at AES, but requires a ISA slot in pc.

Please post your decision and results...

Regards,

Ernie N1AEW

When your software can drive an AMSAT-DL interface on the parallel (or
serial) port, and you can handle a soldering iron, just wire up something
yourself.
To drive a G5400 or G5600 you need maybe $10 in parts for an interface.
Of course, you can always buy a ready-made unit if money is not the problem
and homebrewing is.

With a yagi about 5000 miles long, and pointing vertically
upwards, you are liable to come into contact with MIR
about once a week.

Most whips are only about 20 feet long, and so
are over 4000 miles short.
Anyway, modern whips are not all they are cracked
up to be.

I have had many contacts with Mir using a 1/4 wave mag mount on a cookie sheet. I set it on the porch of my apartment. and drove it with 50 watts.

Hi, Sean...a 5/8 2m mag-mount on a round 9" pie plate atop your fridge will do it. Of course, a 2m mag-mount on a car roof would be better, but to hear and work into MIR or the "RS" birds, simple omni antennae will work with very acceptable results. Then again, A beam on an AZ/EL rotator 100' in the air atop a mountain with automatic computer-driven satellite tracking would be better...perchance to dream. I've worked into MIR, The (US) Shuttle and the RS birds (2m ssb uplink/10m ssb downlink) many times from my car with only 45w or less into a mag-mount. The MIR and Shuttle...even easier: 2m FM simplex! Have fun, Sean! 73 de Tom KB2FIK Bloomfield, New Jersey USA Grid FN20

Use FT-50 with MFJ 1717 antenna.
Saw article in QST at beginning of the year and just did what was suggested
and it worked fine.

No, "electrophonic sound" is, AFAIK still hypothetical, but seems to be
one of the best candidates for explaining a large number of reports of
sounds associated with meteors which are inconsistent with plain old
sound propagating from the meteor to the observer. The other good
candidate is that it's just some psychological phenomenon.

G'day Bill,

Back in 1976, I was a radio tech on a place called Campbel Island,
South of New Zealand in Sub- Antarctic.

I had The priviledge of seeing a spectacular Aurora Australis, The
more so becuase it arrived "as predidicted" as part of my project with
The University of Otago (I think!). This was no gentle flickering
light, it was *almost* violent, like a thunderstorm!!!

It definitly made a noise! Ther were seven of us watching, five of
whom were meteorological observers. We spoke at length about the noise
and tried unsuccessfully to record it. To me it sounded like a buzz,
pitched about 800hz (we did quite a bit of "research" at the time)
with a "soft" start and abrupt finish about two second long and
repeated sort of in time with the waves of the Aurora.

Imagine a "BzzzzZZZZZZT" at about 800 to 1000hz.

It was variously interpreted by the others as a "wail", "whine",
"buzz" or "zip".

When we reported our experience to the University they were rarher
incredulous and muttered things like ...
"...to long away on a lonely island", and
"...mass hysteria"
...but I know better.

I dont have S&T for november yet, it gets to Australia some time in
the first or second week of Nov. but I will surely get this one!!!

BTW, another phenomena we studied was VLF emmisions in the upper atmosphere, called "whistlers". We had a LARGE delta loop...4 turns about 50 meters per leg..., hooked straight into an audio tape recorder via a line amp. The antenna was in a quiet spot about half a mile from the equipment hut. The research was undertaken by the university in association with the Navy, so go figure!!

Norm

My Sky and Telescope has not arrived as yet also, but I definitely can state that on rare occasion, a "blue wizzer" meteor WILL make an audible noise. Sure, it could be a piece of space junk as well! Cliff K7RR

John Glenn IS a hero, the same as all the astronauts. In fact, if you will recall, he put his butt on the line for a substantially riskier mission.

You do recall he was the first American to orbit the Earth?

This doesn't address whether or not he should be on the flight, just that there is a damn good reason why he is called a hero.

To quote you from a previous post Gareth Evans:

"I have been on U.R.A for 4 years and have contributed many times in
response to technical requests from beginners."

What a helpful chap you are!

A few words sprang to mind whilst reading your ever so helpful contribution
above, these being; Freudian Slip and Sexual Preferences. Coupled with the
fact that you seem to invite lots of personal abuse which you appear to get
off on(as you seem to invite more every time you submit a post to this
group), the best course of action would be to bugger off (don't get excited
Gareth) and plonk yourself on alt.sex.masochism or something of that
persuasion.
I'm sure that you will feel right at home.

All the best and Bon Voyage,

David.....

I stand by this; but I also indulge in humorous banter.
Do you have a difficulty with humour?

>What a helpful chap you are!
RIGHT ON!

>A few words sprang to mind whilst reading your ever so helpful contribution
>above, these being; Freudian Slip and Sexual Preferences.
"Sexual Preferences"??? A humorous contribution (or so
I thought; some seem incapable of recognising humour unless
there is a Smiley emoticon, ":-)", to leap up and smack them
in the face) which had no sexual context leads you to think
of "Sexual Preferences"?
Let's discuss your psychology some more!

> Coupled with the
>fact that you seem to invite lots of personal abuse
WRONG! I do not think that a mild rebuke
against childish abuse is an invitation thereto.

> which you appear to get
>off on
There you go again, with talk of, "Sexual Preferences".

>(as you seem to invite more every time you submit a post to this
>group),
I think that you are confusing the uninhibited response from
those who should perhaps consider the long term effects of
their publishing offensive remarks in a public forum with
motivation on my part? Are you suggesting that I should
be battered into submission by an onslaught of
abusive behaviour? Do you prefer that abusive remarks
should be the last word?

>the best course of action would be to bugger off
What prompts you to respond in such a
seemingly childish manner?

>(don't get excited

How times change. I have a recording which I made from,
I think, Oscar 3 back in 1970?
The telemetry-only recording is made up from
a sequence of analogue generated tones. One of
these was a rising note which I understood to be
the outside skin temperature as the temperature sensor
gradually rolled into sunlight.

Master Evans post I presume to be a pathetic attempt at humour.

Sean, a suitable aerial may be a pair of crossed halfwave dipoles, centre fed at 50 ohms and one dipole fed via 1/4 wavelength of 75 ohm co-ax to the other. Crossed reflectors mounted below, with the spacing adjusted for best match or gain would improve things. Don't forget the velocity factor of the 75 ohm cable.

Thanks!

2349. Electrophonic Sounds: AF radio sigs?

Newsgroup: rec.radio.amateur.space
Date: 1998-10-24 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <3632263c.51503502@news.erols.com>
Source record: 14993

The November 1998 issue of Sky and Telescope (page 32) discusses sounds heard by persons watching meteor showers: "Fireballs and intense auroras can produce electrophonic sounds by their audio frequency radio emission, which stimulates real sounds near or even inside the observer."

Holy cow, I'd never heard of that band/mode! Look Ma! No receiver required! Is this for real? Any comments on how these signals are generated and received? Has there ever been any practical application of this phenomenon?

Thanks, Bill (N2CQR)

>I stand by this; but I also indulge in humorous banter.

You seem to be very much alone with your "humorous banter".

>Do you have a difficulty with humour?

Not if it's funny, used at the right time and follows the concept.

>>What a helpful chap you are!
>RIGHT ON!

You are never RIGHT about anything much, are you?

>>A few words sprang to mind whilst reading your ever so helpful
contribution
>>above, these being; Freudian Slip and Sexual Preferences.

>"Sexual Preferences"??? A humorous contribution
(or so I thought;
Thanks for the flowers.

some seem incapable of recognising humour unless
>there is a Smiley emoticon, ":-)", to leap up and smack them
>in the face)
You said it!

>Let's discuss your psychology some more!

Stop fantasizing, you do not possess the ability or depth of understanding
to enable you to do this.

>> Coupled with the
>>fact that you seem to invite lots of personal abuse
>WRONG! I do not think that a mild rebuke
>against childish abuse is an invitation thereto.
>
>> which you appear to get
>>off on
>There you go again, with talk of, "Sexual Preferences".
>

>>(as you seem to invite more every time you submit a post to this
>>group),
>I think that you are confusing the uninhibited response from
>those who should perhaps consider the long term effects of
>their publishing offensive remarks in a public forum with
>motivation on my part? Are you suggesting that I should
>be battered into submission by an onslaught of
>abusive behaviour?
Like I said before YOU invite it, I know of no other on this group that has encountered the same exceedingly high level of abusive comments as yourself. You are a misfit Gareth, and have not been socially accepted into this group.
Numerous postings contain the evidence to support this fact.

> Do you prefer that abusive remarks
>should be the last word?
Abuse comes in many forms, after looking at some of your postings to others they seem to be full of it.

>>the best course of action would be to bugger off
>What prompts you to respond in such a
>seemingly childish manner?

You do Gareth, your behaviour on this NG suggests that this is the only form of expression I can use when trying to communicate something to you.

>>(don't get excited
>>Gareth) and plonk yourself on alt.sex.masochism or something of that
>>persuasion.
>There you go again, with talk of, "Sexual Preferences".

Could be humorous banter Gareth, you don't really know the difference, do you?

Best swishes

David.....

I suppose a fireball could be heard if you were close enough to it!

>by their
>audio frequency radio emission,

audio rf?

>which stimulates real sounds near or even
>inside the observer."

I have observed many meteor showers and heard lots of things but none were due to the meteors. Sure this wasn't a publishers mess up and the article was suppose to be in the April issue? :-)

Fascinating Norm. Thanks. Last night I was lookking at the latest issue of QST. There's an article about the new 136 khz (as in kc) band allocations in Europe. The author points out that this is so close to audio frequencies that the experimenters are using AF amplifiers as their finals!

As I recall the old handbooks made a rather sharp distinction between the frequencies that would produce EM waves and those that would not. Of course the physics texts made no such distinctions. When electrons accellerate...

Ok, how about the other "hero's" who where recently told they where to old to be put on the docket, some younger, some older than Glenn.

Have the press cover that.

Probably not "Politically correct".

I still respect the mans backbone for strapping on a rocket, NOT the system that put him on the new bird and is ACTIVELY ignoring those who did/and are doing MORE for the program.

Sort of reminds me of the presses view of Apollo 13, not a story unless they viewed it as such.

Yes he is a hero, what about the other unsung heroes.

Human detection of ELF is real. It has probably happened to you,
but you may not have realized it. Have you ever noticed that a very
nearby lightning strike goes <click> BOOM? That <click> is not
ordinary sound. It is direct nerve induction. To prove that to yourself,
the next time you're in a severe lightning storm, wear hearing protectors.
The <click> will be just as "loud" as ever while the BOOM will be
greatly attenuated. That shows the <click> isn't ordinary sound.

I stumbled on this while pulling transmitter duty years ago. I had
noticed the <click> but thought it was just an arc in the equipment
induced by the strike. I could never find a sign of damage, however.
Then one day I had a terrible cold and my ears were stuffed up.
I still heard the <click>. That led to using hearing protectors in
the next storm. The <click> is still there, loud as ever. It isn't
being conducted to you as sound.

Now I don't know if that's what's happening in the cases described
in the magazine article or not. It seems to me that the field intensities
wouldn't be high enough in most of those cases. But the idea that
the human nervous system can directly detect ELF is real, and you
can easily prove it yourself.

On a related note, in the early 1960s, a teenager by the name of
Patrick Flannigan invented a device he called the Neurophone. As
reported in Life Magazine, this device used relatively low level
specially *modulated* ELF to directly stimulate the nervous system
and allowed the deaf to hear (at least it worked for some deaf people).

There was a great deal of controversy about this at the time. But the
thing did work (at least for some people, deaf and non-deaf) on which
it was tried. How it worked wasn't understood then (and from recent
poking around I've determined that it still isn't understood or accepted
by the medical community).

It appears to have fallen into the hands of the fringe science crowd today, and has thus lost credibility in establishment circles. (Flannigan himself appears to be a member of the fringe science crowd today.) But that doesn't mean the effect isn't real. Flannigan's recent writing is so mixed with mysticism and junk science that I don't know what to believe about him. But the darn device works. So there must be some physical mechanism involved that allows the human body to interpret ELF as sound that's different from the brute force induction involved in the <click> of a very nearby lightning strike.

Would you of prefered them to Launch our Multimillion dollar satellite
and then have to abort the Mission loosing our un-insured satellite in
the process ?

This 5 series rocket has had it's problems that they seem to of
resolved now.
It's would just about Distroy AMSAT to loose a Satellite because of a
Rush to Orbit.

Been hearing lots about AO-27. Was told the Up link is 145.85
and the down link is 436.8

I can do that with my Kenwood TM-V7 ! Now all I need is antennas, and
how to find out when the bird comes over Seattle WA.

Where should one go for this INFO ?? Steve N7GWG (Go Without Gas)

OK, what about them? How does that in any way detract from John Glenn being a hero? Is John Glenn less of a hero because NASA isn't flying other deserving people? Why are they connected?

You are implying here that John Glenn isn't a hero because other deserving heroes aren't also flying into space. Why does the failure to appreciate other heroes depreciate the actions of John Glenn? Must *everyone* be flown in space for *any* of them to be considered heroes?

Bill,

one of things the University did was to load the modulator section of an old 10kw am broadcast transmitter into 22 miles of disused power line! The idea was to try and stimulate the ionosphere into producing "whistlers" The results unfortunately were inconclusive.

!0 Kw at 10Khz....!!!! now theres an EMI problem for you!!!

Norm

You need a satellite tracking program, I use STSORBIT PLUS. Go here for that program: http://www.dransom.com/

You'll need element sets, go here for those:
http://spacelink.nasa.gov/Instructional.Materials/Multimedia/Satellite.Tracking/Current.Satellite.Tracking.Elements/ELEMENTS.TLE

Go there once a week or 2 for the latest set. save it into the directory you put STSORBIT PLUS in.

Arrow makes a handheld beam, does anyone know where their web site is? Or where to get more info on these? I can't find any info on the Arrow.

73,
Tom

You have Reber's antenna confused with Karl Jansky's antenna. NRAO in Greenbank has a reproduction of Jansky's antenna on the lawn near the visitors lodging. They have the ACTUAL (not a reproduction) Grote Reber paraboloid on the opposite side of the main entrance, south of the laboratory building.

The original plan for "Contact" was to use Grote's callsign W9GFZ, the movie producers changed it to W9GFO, probably thought it sounded better. The call actually belongs to a ham in Indiana, who was not consulted prior to its use. Best part about the movie was the blind character, Kent Clark, who is based on a real life astronomer, Dr Kent Cullers. Worst part of "Contact" was that they changed the ending that was in the book. If you saw the movie but didn't read the book, do so right away!

As far as tracking, if your browser supports java check out the EXCELLENT
stuff at
http://liftoff.msfc.nasa.gov/realtime/jtrack/
No downloading of programs, keps, anything. Jtrack3d is totally cool!
If your browser doesn't support java, get Netscape now! (free)

Because Spaceman spiff, the rest are not POLITICIAN's which calls HIS
selection into scrutiny.

So, WHY was HE selected??????????

I am NOT implying he is not a hero. I am questioning WHY HE was selected.

I am sure you will have an answer.

He was selected because those who have the authority to select him selected
him.

As for motivation, if anyone feels he was selected for political means, then
by all means produce the document that says so. Without such a document,
it's only supposition.

The work he is doing has merit. I want to know why he was disqualified from
the melatonin experiment.

From what I can tell, he's also in the best physical shape of the Mercury
survivors.

It happens that there's a reasonable experiment series that
>John
>Glenn is qualified for, which is all to the better.

I know of two major experiments, one of which was the melatonin experiment
for which he was disqualified. He did say (during an interview broadcast
during TNT's showing of The Right Stuff) that he would have 22 leads coming
out of his body. I don't want to know where :)

It might be wise to cool this thread off for awhile:

As the primary agency responsible for securing a launch opportunity for the Phase 3-D spacecraft, AMSAT-DL representatives are continuing their serious negotiations with a number of launch agencies for a safe and affordable launch for Phase 3-D. As those very sensitive negotiations are still ongoing, to comment publicly on their progress or to identify the specific launch agencies involved at this time would seriously jeopardize those efforts. Just as soon as a firm launch opportunity for Phase 3-D is secured, the details of that opportunity will be immediately reported to you via our AMSAT News Service and other news outlets.
[http://www.amsat.org/amsat/sats/phase3d/update981017.html]

This has come up before. Those outside of the United States often do not understand basic concepts here, such as First Amendments rights, and can confuse statements made by individuals, with statements made by organizations. They further get confused by statements made by individual members of organization, with official statements made by that organization. That confusion occurs often in the 'States and has been a real problem for groups such as the Sierra Club.

So if you're going to make strong statements about the conduct or capabilities of organizations which AMSAT, or the amateur community, might being use of in the future, please be careful to state that this is your view as an individual. I'm not currently a member, so obviously i'm speaking as an individual, but please be especially careful about this if you are using AMSAT.ORG as a return address!

Can anyone help me with a design for a 2M antenna for contacting the MIR space station or will a whip do?

It depends on what part of the world you live in and how much power your transmitter runs. If there are alot of other stations trying to get into Mir at the same time, it could be difficult. Hearing it isn't hard, a 2 meter quarter-wave ground-plane should work fine. Sure, you can go with an eggbeater or a turnstyle, but Mir doesn't tumble, so circular polarization (or polarization diversity) is not needed here. And if the amateur antenna is on the appropriate side of the spacecraft, you should hear it easily. With no one else around, you might be able to work it with 5W and a modest antenna, but you'll probably want more power than that for a reliable packet (or voice) connection. When you do, try UI packets if your software permits, as sharing works better that way.

Now, terrestrial omni gain antennas are no help at all here (except when Mir is close to the horizon); indeed, they can be worse that a 'whip' for most space purposes. So, see if you can hear it, and improve your setup so you hear it well, and come back with more questions. (And hopefully there will be a few of us here who want to talk technically and not get into flame wars and ... [oh, nevermind].) Or maybe things will just work for you and we'll hear you on the birds instead of USENET!

73's and good luck!

-- KD6PAG ("Networking Old-Timer, RF newbie")

http://qsl.net/kd6pag/MIR.html (which is a bit stale at this point)

Since he is not in a position of authority at NASA, the only way he could have chosen himself is if Congress voted to do so. When did Congress, or at least the subcommittee, take this vote, and where in the Congressional Record can it be found?

And they have poaperwork that proves that John Glenn was chosen specifically for political purposes? Neither of them are in a position to choose astronaut clues. How would they get such a paper?

Sorry, dude, the Administration could just lean on NASA to have it
happen, and it wouldn't show up in the Congressional record.

Most anything that resonates well will do! Of course you will not be able
make contact all the time it is in sight but when it is overhead you will
hear it and it will hear you. I started out with an omni directional
antenna. They take up very little space, are very broad banded and you can
transmit on 144 and 440 MHz. Moreover, they cost about $60

I use a homemade ground plane antenna built fromm 5 coathangers and a SO-239 chassis mount connector. I also connect to Mir using a MFJ mag mount dual band antenna and do so both ways only running 5 watts. You don't need anything fancy for Mir, just something nice, simple and basic will do the trick. Check out http://www.tigertronics.com for a article about me and my mobile packet contacts with Mir. Have fun and good luck!

I have had very consistent results with my scanner antenna, which is a
discone, and has 1:1 VSWR on 2, 70, and 1.2GHz. I can always connect,
using some 50 watts from my Icom dual bander. It gives me quite a few
minutes of operation, to the disgust of a local G3!

Ken,
Thank-you for your opinion. For some reason, I
missed this post and so had not replied to it. I
believe that it is right and proper that civilisation
should not be beaten into submission by the bullies;
for such was the way of the Nazis, the Fascists and
the Communists. Ham radio has its tradition of
gentlemanly behaviour, in pursuit of the philosophy
of, "Hands across the sea.". (Or was that the BBC?)
Gareth.

>wrote:
>>You seem to be very much alone with your "humorous banter".
WRONG! Humorous banter is found in all threads
in this NG - a clever slightly changing of subject
followed by long chains of irrelevant-to-the-thread
humour. Those in this NG who are being abusive
have "bled over" from threads in adjacent channels.

>>You are never RIGHT about anything much, are you?
WRONG! It is the fact that I am usually right that
those with a lower level of social confidence
seem unable to accept without resorting to abusive remarks.
(On those, admittedly RARE, occasions that I am wrong,
and can be proved to be wrong, then I have never had any
difficulty in publicly withdrawing, and if necessary,
apologising.)

>>>Let's discuss your psychology some more!
>>Stop fantasizing, you do not possess the ability or depth of understanding
>>to enable you to do this.
You have no basis upon which to make this
statement.
I have a psychology qualification. Do you?

>>>There you go again, with talk of, "Sexual Preferences".
>>>>(as you seem to invite more every time you submit a post to this

>>>>group),
WRONG! I have never invited you, or even others,
to talk of "sexual preferences".

>>Like I said before YOU invite it,
WRONG! I never invite such. I wonder how you
construe a plea for mature and civilised
behaviour to be an invitation for a discussion
on "sexual preferences"? This is, perhaps, an
interesting insight into your psyche?

>> I know of no other on this group that has
>> encountered the same exceedingly high level of abusive comments as
>> yourself.
WRONG! I am not a group; and if you have not come
across this type of Flame War before,
then you must be a newbie on Internet?
(Thank-you for the acknowledgement that the comments
directed at me ARE abusive. If you feel them to be
"exceedingly high", then why prolong them?)

>>You are a misfit Gareth, and have not been socially accepted into this
>>group. Numerous postings contain the evidence to support this fact.
Numerous postings from a small subset of childish people,
who do not seem to know of maturity in their remarks?

>>Abuse comes in many forms, after looking at some of your postings to
>> others they seem to be full of it.

WRONG! You will find no abuse in my postings;
VERY occasionally I will be provoked by the risible
comments of you and others.

>>>What prompts you to respond in such a
>>>seemingly childish manner?
>>You do Gareth, your behaviour on this NG suggests that this is the only
>> form
>> of expression I can use when trying to communicate something to you.
The ONLY form of expression? Hmmmm.........
What? A plea for respectable behaviour, in the
gentlemanly traditions of Ham Radio prompts you
to respond in the habitual manner that you do?
Hmmmmm.....

>>>There you go again, with talk of, "Sexual Preferences".
>>Could be humorous banter Gareth, you don't really know the difference, do
>>you?
Well, if it were not for the apparently vituperative manner
of your remarks, it might be; except that you acknowledge
above that you are responding in a childish manner.

WRONG!!!!!!!! You have misquoted me Mr Cut and Paste Evans.

>>> I know of no other on this group that has
>>> encountered the same exceedingly high level of abusive comments as
>>> yourself.
>WRONG! I am not a group; and if you have not come
>across this type of Flame War before,
>then you must be a newbie on Internet?

WRONG!!!!!!!!!!!!!!!! Never stated that you were a "group".
WRONG!!!!!!!!!!!!!!!! Have been on the net just over two years(no comments
please).

>(Thank-you for the acknowledgement that the comments
>directed at me ARE abusive.
RIGHT!!!!!!!!!!, for a change.

>If you feel them to be "exceedingly high", then why prolong them?)
Because I don't like you.

>>>You are a misfit Gareth, and have not been socially accepted into this
>>>group. Numerous postings contain the evidence to support this fact.
>Numerous postings from a small subset of childish people,
>who do not seem to know of maturity in their remarks?
WRONG!!!!!!! Only in your opinion.

>>>Abuse comes in many forms, after looking at some of your postings to
>>> others they seem to be full of it.
>
>WRONG! You will find no abuse in my postings;

WRONG!!!!!!!! You have been rude to quite a few people, this counts as
abuse.

>VERY occasionally I will be provoked by the risible
>comments of you and others.
What are you trying to say Gareth?

>>>>What prompts you to respond in such a
>>>>seemingly childish manner?

>contrive anything.

Chris,

Would you mind naming some of those "more capable elderly astronauts?"

What is it that makes John Glenn a less capable astronaut just because he is a politician?? Why did you capitalize the "P" in politician and the "A" in astronaut? Hmmm....me thinks this is a deep seated problem you have. Of course, this is only MY opinion.

Sure!

Story Musgrave, helped fix the Hubbell, 63
John Young, flew the first Space Shuttle mission, 68.

Hey, if you are just looking to re-commission someone who made history, why not go to the beginning, Alan Shepherd.

> What is it that makes John Glenn a less capable astronaut just because he is
> a politician??

Uhhh, he's been away in Washington for a "few" years?

> Why did you capitalize the "P" in politician and the "A" in astronaut?

I don't know....I goofed?...

Naaaah, you miss the point.

In his position he has enough "juice" that a mere mention of
his desires "in private" would work its way up the chain.
No doubt he saw it work for Jake Garn...remember him?

Any Senator that can't do something like that is too
ineffective and should never have been elected.

I guess that I'm still mad at him for delaying Senate
ratification of the International Telecommunications
Convention revision a number of years ago because he was not
satisfied with some answers provided by NASA to one of his
inquiries. (Me, I have this soft spot for the ITU treaties
and regs....)

Astute observers of "the business" knows that there has been
a quiet pizzing contest between them ever since he was
refused a "second ride" and he quit in disgust.

Hey, as a kid I wanted to be a fireman.......roll out that
big truck.... <ggg>

SB SPACE @ ARL $ARLS014
ARLS014 New amateur satellite package launched

ZCZC AS14
QST de W1AW
Space Bulletin 014 ARLS014
From ARRL Headquarters
Newington, CT October 27, 1998
To all radio amateurs

SB SPACE ARL ARLS014
ARLS014 New amateur satellite package launched

SEDSAT-1, Amateur Radio's newest satellite, launched successfully October 24 from Cape Canaveral. However, after fewer than two dozen orbits around Earth, reports indicated problems with the spacecraft's batteries and solar panels. SEDSAT-1 was fabricated by students at the University of Alabama-Huntsville. It was boosted into space by the same Delta II rocket that carried the Deep Space One probe. The package contains a Mode L digital store-and-forward transponder and a Mode A analog transponder.

Chris Lewicki, KC7NYV, of the University of Arizona Student Satellite Project, reported earlier today that telemetry from SEDSAT-1 indicated the spacecraft's power had dropped to zero at one point and the satellite reset itself. Intermittent telemetry suggests the batteries are not storing their specified 8 Ah. Lewicki said the satellite went quiet halfway through a pass over Tucson on orbit 27, indicating it had gone into its ''power cycle'' mode. Lewicki said in this state, the satellite notices that it is in extremely low power conditions and waits 10 hours until attempting to transmit again.

The solar panels appear to be producing as much power as expected, but Lewicki said they are ''slow to react when exiting an eclipse period,'' so charging does not start until at least 10 minutes into a daylight cycle.

As a result of the power cycling, images of the satellite's deployment from the booster were lost.

Lewicki is seeking monitors to listen and decode telemetry for periods when the spacecraft is nearing the end of its day cycle and entering eclipse. The downlink is 437.91 MHz, 9600 baud FSK (with adjustment for Doppler shift). A telemetry program is available at

the SEDSAT Web site, http://www.seds.org/sedsat/tracking.

''To use it, you must put your TNC in KISS mode and must set the appropriate COM port parameters,'' Lewicki said. Current two-line Keplerian elements also are available at the SEDSAT Web site.

E-mail telemetry reports including the orbit number, your latitude/longitude, UTC, and brief description of hardware used to telemetry@seds.org.

Lewicki said nothing was heard from the spacecraft in Phoenix at 1200 UTC October 26, nor was it heard in London on a later orbital pass.

SEDSAT coordinator Mark Maier, KF4YGR, at the University of Alabama-Huntsville said the satellite's initial telemetry was nominal except that power numbers were below prediction on earlier orbits. He said the satellite's orbit ''processes out of North America for fairly long periods''-a half a day or more at a time.

For more information, visit the SEDSAT Web site at http://www.seds.org/sedsat/.

Political or PR space rides are not new. Was in Jake Garn or Orin Hatch
from Utah that took a ride a few years back? I think we even put up some
"plain folks" after the Challenger disaster, basically for PR purposes.

I can't say we should begrudge Glenn a ride on the Shuttle. I consider
that this guy was first a test pilot in an age where test pilots crashed and
burned on a regular basis...then he was an astronaut flying on rockets
that were exploding on a regular basis, and he did something nobody had
ever done before. The guy had stones so big I'm still amazed they could
get him through the hatch on the Mercury capsule. There are only four
of the original Mercury 7 left...I think if anyone were to go do this it should
be one of them, so if Glenn's status as a politician got him to the head of
the line, it was only in front of the other three guys I'd see as deserving of
a shot like this.

I think it's fitting to let one or all of the guys who started this whole thing
have a relatively comfortable, safe ride using the fruits of the knowledge
they pioneered. It's great PR, the majority of the taxpaying public doesn't
seem to mind, and it's a neat sort of closure to the most shining example of
mankind's achievements in the 2nd Millenium A.D.

No harm, no foul, IMHO.

Why did he retire, anyways?

> John Young, flew the first Space Shuttle mission, 68.
>
I've read interviews in which he says he just doesn't see how he could
justify another trip. This was before Glenn, so I'd love to hear his current
opinion.

>Hey, if you are just looking to re-commission someone who made history, why
>not go to the beginning, Alan Shepherd.
>

Well, that would be tough right about now...

He could still provide useful data. NASA carries a head into space
occasionally to study radiation effects. No reason not to retire the current
model, freeze, slice, sensorize, and glue back together Shepard's head.

>> What is it that makes John Glenn a less capable astronaut just because he

He's got a point here. I'd be more impressed if Glenn had spent his time off
from Congress in a dunk tank or a simulator.

It was Senator Garn and Congressman Bill Nelson from Florida.

Billy-Boy used commercials stating that he had "been tested at the edge of space" in run for insurance commissioner. This annoyed me to the point where I refused to vote for him, and a lot of other people felt that way too.

Garn did a few scientific things, at least- I've never seem what Nelson was supposed to have done. Nelson's flight was the one just before Challenger's last. How unfortunate the passengers couldn't have been switched.

No doubt; however, without a document or a tape recording in which it is *specifically* said that Glenn was picked for political purposes, any such event is suppositional at best, and a belief in such an event says more about the believer than it does about the NASA selection process.

Did it occur to you that this might have nothing to do with politics, but is instead the first time NASA has been able to make up to Glenn what Kennedy did? I don't believe this to be the case, but there are a lot of people still at NASA who was there when Glenn flew and felt he deserved to fly again? He was robbed by Kennedy for political purposes; if Glenn uses a little politics to get what he long ago earned, I'm not going to complain about it.

Well at least they proved something. The Glenn flight will prove
nothing, will cost more, and will lead to no improvement in the rate at
which we open the space frontier.

> >Conclusion:
>
> >Use Arianespace if you don't care if you get screwed.

On the whole, working with Arianespace tends to be a whole lot less
screwy than working with NASA, which is not intended to deny or
disparage your statement in the least.

Indeed.

See http://www.houstonspacesociety.org/ist/edit19981025.html

If John Glenn had been anything at the time other than more spam in yet another can, I would agree that he *was* a hero.

After joining the ranks of the Keating Five, who together received about $1.3 million in identified campaign contributions, then turned around and helped Charles Keating avoid investigation in what would turn out to be the largest thrift failure in American history, costing American taxpayers some $2 billion, Glenn became just another scum sucking politician. Even after he was told that there were criminal charges pending against Keating, Glenn helped arrange a luncheon with another prominent (and lately discredited) politician, Jim Wright then-Speaker of the House. For his sins, the Senate Ethics Committee cited him for questionable conduct.

The man is not a hero. He's scum. Scum like him have been screwing over the taxpayers of this country for decades. Scum like him would rather see upwards of a billion dollars spent on his junket into space than see the same seat filled with a useful scientist. Scum like him want to see the aging shuttle fleet perpetuated just so the likes of him (and perhaps, if he has his wish, Strom Thurmond) can fly on it. Clearly, there are better ways to open the space frontier. Left in private hands, that money would do much greater good.

> You do recall he was the first American to orbit the Earth?

No, I don't seem to recall that at all. My recollection is that "Nov 29, 1961 (Mercury-Atlas 5) space chimp Enos made 2 orbits around the Earth and was successfully recovered."

Enos was the first American to orbit the Earth. Glenn was just a slightly larger primate test subject. Nothing heroic about being shot out of a cannon, either.

> This doesn't address whether or not he should be on the flight, just that
> there is a damn good reason why he is called a hero.

Actually, it doesn't do that, either.

> >Oh well, God speed, I wish anyone well who straps on a rocket.

A generous attitude. Not one that I share. I wish his astronaut escorts well, though.

This evidence is unlikely whether he was picked for political purposes
or not.

I find your insistance that I am *bad* unless my beliefs about this
situation are the result of a signed confession of rather dubious
morality by itself.

So there :-)

Tough. If you'd followed his rhetoric and compared it with performance AND
had to live with the consequences you might think otherwise.

We'd be better off if we had lost a politician than a teacher.

Unfortunately, it actually happened, but the other way around. Greg
Jarvis was bumped from 61C so Nelson could fly. He wound up on 51L.

What has morality got to do with it? He either was or was not chosen for political means. If he was chosen for political means, it would take either a document stating that was the case signed by the person with the authority to make the decision, or a verbal statement by the same person to that effect. Anything short of that will simply be supposition.

Any implication that you are "bad" is your own; no such implication can be drawn from my statements. *I* have made no statement about you at all.

No, Enos was the first animal lofted into orbit by an American spacecraft.
If he was declared a citizen before his flight I certainly didn't hear about
it. What law allows an animal to be an American citizen?

John Glenn remains the first American to orbit the Earth.

No, but standards and customs, which are the law in the absence of a statute or court decision under common law, do restrict citizenship to humans.

Name an animal that was declared to be a US citizen. As was pointed out by someone else, Enos wasn't American in any case- at best he was a resident alien. If you want to make this distinction, he was an *illegal* alien because he didn't have a green card.

The amendment that is lately referred to as the 14th
>Amendment (though there is considerable evidence that 14 other
>amendments were ratified previous to it, which would make it the 15th
>Amendment) says that any person born in the US or naturalized in the US
>is a citizen. It does not further define person.
>

OK, then, where can Enos' citizenship papers be found? He wasn't born here, and if there are no papers there was no naturalization, either.

>If chimpanzees are capable of language, there is every reason to treat
>them as persons. There is considerable evidence that chimpanzees are
>capable of language. Personally, I'm not threatened by extending the

Tang and vodka-Smirnoff, to be exact.

A space screwdriver.

And those are coffee grounds on my Cheerios. Gotta have that caffeine.

Yep. I was going for silly from the moment I mentioned Enos.

As Roald Dahl has pointed out, "A little silliness, now and then / Is
very good for the minds of men."

The ridiculous are there to be ridiculed, it seems to me. What better
way to ridicule Glenn than to compare him to a chimp?

For a less silly treatment of chimpanzees in society, see L. Neil
Smith's _Probability Broach_, _The Venus Belt Wars_, and _Tom Paine
Maru_ to name a few.

I agree the pioneer astronauts are due a flight on the shuttle, to
enjoy the fruits of their labor. Many shuttle flights have enough
margin to squeeze one more passenger onboard (although these
opportunities will be few and far between during space station
assembly), so NASA should offer rides to the people who blazed the
space development trail for us, whenever they have the shuttle margins
to do so. NASA could have launched five shuttle loads of former trail
blazers this year for not too much more than they spent on shuttle
operations anyway! :)

"I think that we should be men first, and subjects afterward. It is not desirable to cultivate a respect for the law, so much as for the right. The only obligation which I have a right to assume is to do at any time what I think right."

From your answers, I suspect you have no idea what moral philosophy is doing in your life.

> He either was or was not chosen for political means.

Yes, that forwards the discussion nicely.

Goldin admits that Glenn nagged. Goldin claims that he insisted that an "independent" authority, I think he said the head of the National Institutes of Health, had to call Goldin to verify that there was real science being done. Anyone who believes that there is no influence from Congress upon the funding of the National Institutes of Health should please review this budget information here.

> If he was chosen for political means, it would take either
> a document stating that was the case signed by the person with the authority
> to make the decision, or a verbal statement by the same person to that
> effect. Anything short of that will simply be supposition.

Perhaps. Your standards of evidence are extreme. Much less has been used to convict greater men of more heinous crimes, in front of juries.

Given the emphasis which Washington, DC politicians place on "plausible deniability" it is not surprising that there is a shortage of documentation to suggest that Glenn is being taken on his junket for political reasons.

Supposition is a good thing. It is how we find the evil that men do.

> Any implication that you are "bad" is your own; no such implication can be

spaceman wrote:

> No, Enos was the first animal lofted into orbit by an American spacecraft.
> If he was declared a citizen before his flight I certainly didn't hear about
> it. What law allows an animal to be an American citizen?

Your post did not specify an American citizen.

There is no restriction in the US Constitution limiting citizenship to born humans. The amendment that is lately referred to as the 14th Amendment (though there is considerable evidence that 14 other amendments were ratified previous to it, which would make it the 15th Amendment) says that any person born in the US or naturalized in the US is a citizen. It does not further define person.

If chimpanzees are capable of language, there is every reason to treat them as persons. There is considerable evidence that chimpanzees are capable of language. Personally, I'm not threatened by extending the rights and duties of citizenship to all the chimps born in the US.

> John Glenn remains the first American to orbit the Earth.

Enos remains the first American to orbit the Earth. It is a mere quibble on your part that John Glenn might be a citizen and Enos might not be.

My dictionary, the 1980 edition of American Heritage, defines "American" as "of, relating to, or characteristic of the United States of America..." which certainly covers Enos, who was of the United States and related to the United States. In definition 4, it points out that American is often used with plant and animal species.

If you had meant to say that John Glenn was the first American human to orbit the Earth, you might have said so. It is also the case that John Glenn served the function of being a somewhat larger primate test subject, performing about as much as might be expected of spam in the can.

Your conclusion that by being a primate test subject for NASA John Glenn became a hero is not a point to which I will agree. You seem to have decided to ignore the issue of whether being shot out of a cannon is heroic.

What is courageous and noble about being the second American primate test subject to orbit the Earth? No ticker tape parades for Enos? Awww.

Just about anyone who isn't (a) working for government, (b) seeking office or holding office or previously an office holder in the government, (c) advocating more government for any reason.

Certainly anyone who is not an advocate of gun control measures higher than anyone who is, and Glenn is about as much for victim disarmament as anyone in America.

> Can anyone else, (and I do mean ANYONE ELSE) in the public
> eye measure up to this guy?

Yes. Anyone who hasn't taken about a one-fifth share of $1.3 million in exchange for efforts to call off the investigation by the FSLIC into the largest thrift failure in US history would be a good place to start. John Glenn's efforts on behalf of Charles Keating were reprehensible, and he was cited for improper conduct by the US Senate. Keating's efforts cost the US taxpayers about $2 billion.

Now Glenn is going to get on board a shuttle which is going to cost the American taxpayers another $1.5 billion or so to launch, depending on how much of the design, development and production costs you want to assign to each flight. He gets another ride in space. We get almost no useful scientific information as a result. Another costly stunt from one of the Keating Five.

That qualifies him as scum, as far as I'm concerned.

> What's the problem, you've discovered that he's only 99% perfect?

No. I discovered some years back that he was 99 and 44/100ths% pure scum. About 1991, as I recall.

> Sorry, I've been watching John Glenn
> for almost 40 years, and he is the real thing - an American hero.

I disagree. Can't tell you how disappointed I am, either.

I can tell you that I traipsed around the snow in New Hampshire in February 1984 working for his campaign for president. I can tell you that I used to believe in John Glenn, and I used to believe in NASA. I can tell you that I was very, very disappointed when the information

came to light about his deplorable role in the Lincoln Savings and Loan failure.

If he's your idea of a hero, my immediate response is, "There is no accounting for taste."

Geeeze, Let's start a list of who is a real hero. It's not "fly me
cuz I deserve it" Glenn!

How about Story Musgrave, ANY of the engineers who put Glenn in space,
Robert Goddard, oh man, what a list this could be. John (everybody watch
me, here I go, ain't I great) Glenn is way down on the list.

Hi Tommy!
Here you go! No Sarex this flight though as you already know...

Space Shuttle/Mir Radio Coms - As of: 10/27/98

(Sarex is now known as the Space Amateur Radio EXperiment)

Space amateur Radio experiment (Sarex) Downlink: 145.550 FM
This is for both voice AND packet modes. So if you hear short
bursts of noise they are in packet mode.

Some amateur radio 2 meter FM repeaters carry live air to
ground coms. Go here to get a list of shuttle freqs around the country:
http://www.amsat.org/amsat/sarex/shutfreq.html

If your in the NYC metro area try the W2FCL repeater in Northern N.J.
on 146.610. I pick this repeater up from about 100 miles away easily on an
Icom 2000H and a Ringo Ranger vertical up about 27 feet.

On HF, WA3NAN - the Goddard amateur radio club
re-transmits the missions on: 3.860 LSB (all freqs. in single side band)
7.185 LSB
14.285 USB
14.295 USB
21.390 USB
21.395 USB
28.650 USB

These are dependant on propagation! In South Eastern N.Y. I pick them up on
the 80 and 40 meter frequencies (the first 2) the best.
They I.D. in morse code and voice. Park on a freq. and listen awhile,
coms are not non-stop! There are sometimes long breaks in the action.
When the astronauts are asleep they are off the air. If the weather is
bad at the station or no control operator is available they won't be
on the air either. This is a volunteer service. Thanks to WA3NAN for
providing this service!

Mir 2 meter FM amateur radio downlinks are currently on 145.800 (Europe)
and 145.985 in the U.S. These are for both voice AND packet radio.
So if you hear short bursts of noise they are in packet mode. The latest crew
members (Mir 26) are in packet mode most of the time as the current crew
doesn't seem to use voice mode. Their English isn't all that good but they do
now accept packet messages written in English. So if your a ham and can get
into the Mir packet mailbox (R0MIR-1) leave them a hello and wish them all the
best!

There is a ground control freq. of 143.625 FM that is sometimes
used as well, but NOT for amateur radio. I hope you speak Russian!

Mir is also now on 70 cm with voice downlinks on: 437.950
437.925
Packet downlink: 437.975

Happy listening!

Sorry to hear you were holding your '820 when you got hit. Next time you plan on taking your '820 outside, check the local weather first and if thunderstorms are forecast, leave the rig at home...this way you won't damage a radio that would have been ok if left at home. Also, holding an '820 has been known to attract or draw a lightning strike due to its size and the lightning bolts "perception" that it is a good ground...(we know an '820 will act as a counterpoise to a lightning bolt and is only a good path to ground if the carrier of the rig is wearing spiked shoes. So remember...if you must walk around with your '820 outside, avoid open spaces, stay out from under trees and utility poles, large metal objects and never wear spiked shoes. Even a far-off storm can suddenly turn your way and mess up your day.
(I hope you don't mind the friendly ZAPPING)

Exactly. Therefore, if having such a belief is not a bad thing, then a
person having such a belief would not necessarily be bad for having it. It's
nice to see we agree on this.

I have been getting a check sum failure lately when entering NASA elements in my InstantTrack program. I would like to know if anyone else has the problem and also how to calculate the check sum. The data looks good and seems to work once I get it into the program.

2478. Shuttle audio

Newsgroup: rec.radio.amateur.space

What are the legal issues of a temporay, 1 week, repeater on 446.00 for a special event such as rebroadcasting shuttle audio. Due to having to piece together a system last minute, because of the original machine going away.
Thanks
Tom

The checksums are pretty useless these days. If your prediction program
works, I'd advise you to ignore them. However, if you want to see how
to calculate them, the material at
http://celestrak.com/NORAD/documentation/index.html
explains it.

i think John Glenn is a very smart man! NASA said he was more in shape
than some of the other astronauts. I think he was due for this.

2484. 70cm pre-amp

Newsgroup: rec.radio.amateur.space
Date: 1998-10-31 00:00:00 UTC
From: John Robertson <robo@enterprise.net>
Message-ID: <363B63ED.36C@enterprise.net>
Source record: 14785

Hi all

Can anyone point me at a circuit for a decent
pre-amp for 70cm? (mast head switching also)

Also I've just purchased a Tonna 19 element
crossed 70cm beam with no instructions.
The offset between the two beams has me confused!!
(not difficult)
I'd like to install some kind of polarisation
switching arrangement - can anyone help me out
with a copy of the instructions - or some matching
details?

Thanks
John GM1VPZ

Standards and customs do not make law, and would not make good law.

> Name an animal that was declared to be a US citizen.

By whom? Assuming any entity has the power to declare an animal to be a
US citizen is tantamount to admitting that animals may be citizens.
Would you suppose the US Supreme Court has this power?

> As was pointed out by
> someone else, Enos wasn't American in any case- at best he was a resident
> alien. If you want to make this distinction, he was an *illegal* alien
> because he didn't have a green card.

An interesting point. You see how much good it can do to start a silly
thread?

Of course, I'm going to take the position that Enos was an African
American.

After all, the naturalization process must be different for animal
citizens. He certainly served our country. And you still deny him
citizenship. How sad.

> OK, then, where can Enos' citizenship papers be found?

Dude. Where are your citizenship papers? I have a birth certificate
and a passport, but neither of these are citizenship papers.

The customs service cleared Enos for entry into the United States.
That's more than enough for me.

> He wasn't born here,
> and if there are no papers there was no naturalization, either.

Well, knowing the government there are considerable papers. The
question of whether they constitute citizenship is just another silly
point for us to argue. I must admit I'm enjoying this greatly.

> But until the law expressly does so, they are not.

Well, what if custom does so? Are we to have customary law?

Actually, the rule in the US is that which is not prohibited is permitted. Unless the law expressly prohibits animals from being citizens, they are.

> Risking your life generally is.

You risk your life every day.

> The fact that John Glenn was the first American makes it so.

He was the second primate launched by America. Big deal.

> Why should we celebrate an illegal alien?

Why not? Plenty of illegal aliens have contributed a great deal to our economy.

Yesterday in the early hours of the morning i clearly picked up russian speech on 143.6250 nfm, this is the space-earth channel of mir, but as far as I know there is nobody up there !.

Despite the fantastic skip conditions in the 27 mhz range from russia at present i cannot see how this could have been direct from russia on this frequency,so does anybody have any ideas or did anybody hear this aswell?.

Ian Koenig.

There are 2 cosmonauts up on Mir. You heard them talking to ground
control. It's a relay. They use the frequency quite frequently.

On the contrary, standard and customs is exactly what the courts refer to if the law does not cover an issue- standards and customs are highly important in the Uniform Commercial Code.

You were the one that claimed an animal was the first American to orbit the Earth- you're just having a hard time accepting your error.

John Glenn remains the first American to orbit the Earth.

Actually, it would take an Act of Congress to modify the naturalization laws; I suspect the President might be able to do so in an Executive Order.

>> As was pointed out by
>> someone else, Enos wasn't American in any case- at best he was a resident
>> alien. If you want to make this distinction, he was an *illegal* alien
>> because he didn't have a green card.
>
>An interesting point. You see how much good it can do to start a silly
>thread?
>

<Slap!>
I knew that...

Hey, weren't the Germans in Operation Paperclip also illegals for some time?

>Of course, I'm going to take the position that Enos was an African
>American.
>

Of what African nation was he also a citizen? Unless he was simultaneously a citizen of an African nation as well as the United States, then he was no more *African* American than I am. Having dark skin and ancestors that were once from Africa does not make one African American. If you were born here, and cannot claim simultaneous citizenship elsewhere, then you're just American- and what more do you need?

>After all, the naturalization process must be different for animal
>citizens. He certainly served our country. And you still deny him
>citizenship. How sad.
>

Not me- hey, I think he did a fine job and earned it. I don't know of many posthumous naturalizations, though.

>> OK, then, where can Enos' citizenship papers be found?
>
>Dude. Where are your citizenship papers? I have a birth certificate
>and a passport, but neither of these are citizenship papers.
>

In this country, a birth certificate identifying your birthplace as someplace in US territory, or at least one parent that is an American citizen, IS a citizenship certificate.

>The customs service cleared Enos for entry into the United States.
>That's more than enough for me.
>

The Customs Service also cleared a Russian reactor. I don't suppose you want to declare it a citizen also?

>> He wasn't born here,
>> and if there are no papers there was no naturalization, either.
>
>Well, knowing the government there are considerable papers. The
>question of whether they constitute citizenship is just another silly
>point for us to argue. I must admit I'm enjoying this greatly.
>

It does raise some interesting points that weren't covered in my very brief Constitutional Law class.

>> But until the law expressly does so, they are not.
>
>Well, what if custom does so? Are we to have customary law?
>

If the statutory or common law does not cover the matter- it would help to provide some examples of animals that were made US citizens through custom. You have to have a custom that isn't covered by statutory law or case law in order for it to be used as the law.

What about Max Headroom- how would an artificial intelligence fit into this?

>Actually, the rule in the US is that which is not prohibited is
>permitted. Unless the law expressly prohibits animals from being
>citizens, they are.
>

Citizenship is still regulated by the government. In order to be
naturalized, you must be declared a US citizen by a judge. Even if animals
born in this country were citizens, unless he was formally naturalized Enos
would not be.

>> Risking your life generally is.
>
>You risk your life every day.
>

And as far as the people whose opinions matter, that makes me a hero.

>> The fact that John Glenn was the first American makes it so.
>
>He was the second primate launched by America. Big deal.
>

But the first American, and that makes it a big deal.

>> Why should we celebrate an illegal alien?
>
>Why not? Plenty of illegal aliens have contributed a great deal to our
>economy.
>

Which does not mean they should be celebrated. Except, perhaps, in the way
that criminals are celebrated today, by publishing books about them.

I have heard it in the past on the same frequency. I think it is direct from the space station. The height makes it possible.

The passes typically last anywhere from a few minutes to 10 minutes or so
depending on how high they get in your sky. Mir HAS to be flying over your
area for you to hear them on that freqency.

2502. Metal Vehicle Reflectivity

Newsgroup: rec.radio.amateur.space
Date: 1998-11-02 00:00:00 UTC
From: daveseag@io.com
Message-ID: <363d4f0d.478357804@news.io.com>
Source record: 14803

I'm creating a model for radio and radar technology, and it would
be useful to know the average radio reflectivity of a typical vehicle
made of metal (such as a civilian aircraft), expressed as a
percentage. Can anyone give me a good figure for this?
I'm also interested in aquiring information about the AN/SPY-1
radar; specifically the cost, weight, and volume for the phased-array
antenna and for the transmitter/reciever circuitry unit. This is the
radar that's a part of the Aegis system on many U.S. Navy cruisers and
destroyers. Also, who makes this radar?
All of these questions are for simulating radios and radars in
space on an Excel spreadsheet for spacecraft design. Any
nonclassified help would be appreciated.

2514. What's up there on 400.1 Mhz?

Newsgroup: rec.radio.amateur.space
Date: 1998-11-04 00:00:00 UTC
From: vera2@netcom.com
Message-ID: <vera2F1vvDq.9v8@netcom.com>
Source record: 14815
Cross-posted to: rec.radio.scanner,rec.radio.amateur.space

I'm looking for info on what is transmitting CW/NBFM carriers
on and about 400.1 Mhz. The signal constantly changes frequency
about a 5 Mhz range with a period between 1 to 2 hours. It's
hard to tell since there seems to be several sources. I think
I'm dealing with multiple satellites of some sort. The
frequency is registered to Orbital Sciences Corp and to the
NIST according to my PerCon database. To tune it I'm using
a PCR1000, CW, BW=3Khz, CF=400.1 Mhz, and a 4 foot outdoor
whip antenna. Then it's a matter of
waiting until hearing a changing CW tone - no more than 20
minutes. So can anyone give some more insight into what
this is? TNX

BTW I'm also interested if anyone outside the Dallas
area can receive this.

2515. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.space
Date: 1998-11-04 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <71ordm$lmk@news.Hawaii.Edu>
Source record: 14816
Cross-posted to: rec.radio.amateur.space,rec.radio.broadcasting,rec.radio.cb

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Hello all,

I was wondering what information was needed to receive a QSL for a Mir packet contact. This contact being with the mailbox of course. I did manage to send a message. I have the message number and other info here. Is that all I need?

Also, Mir has been an easy catch here around 4am est. It seems that everyone out here is sleeping. Guess they don't know what they're missing eh? :) I usually only see two or three other stations that time of night.

I do hear it in the Netherlands as well (on an ICOM R7100) and I recall
having heard about this and listened to it before.
It clearly is a LEO satellite (system). The sat that I am hearing right
now has the same familiar doppler rate as I know of the 435 MHz pacsats.
I think you mean a 5 KHz instead of a 5 MHz range, and actually it is
about 7 KHz up and down from the center.

2521. MIR visibilty

Newsgroup: rec.radio.amateur.space
Date: 1998-11-04 00:00:00 UTC
From: Adrian Jannetta <jannetta@globalnet.co.uk>
Message-ID: <71q274ksg1@newnews.global.net.uk>
Source record: 14822
Cross-posted to: rec.radio.amateur.space,sci.astro.satellites.visual-observe

I am writing a Monthly Night Sky article for a local magazine. I have been asked to include dates/times for observing MIR. I have no problem finding the internet sites or astronomy programs to get the relevant information. However, assuming no alterations are made to the orbital elements other than those which occur naturally (drag, etc) how far into the future can worthwhile predictions be made with any particular set of elements? After a month or so will they be accurate to the nearest minute? Nearest fives minutes? Ideally I would like to be able to make predictions of MIR's visibility for the next month assuming the deadline for the article is a week or so before the start of that month.

Many thanks

Adrian

For the lower power stations early morning hours are the best chances.
Also note that IF the Mir digi is on please use unproto mode only. Don't
connect to others through Mir, it screws up the PMS I'm told.

73 AND CONGRATS! They have a nice card!

There are a number of satellite frequencies in this area. Some of the big
Geostationary satellites like GOES 9 transmit WX info, etc. around 401 MHZ.

I thought they shut down RS-12 and switched to RS-13 which has slightly
different frequency range. Check your favorite resource for specifics.

Last I checked (about a week ago), both RS-12 AND RS-13 were operating.
RS-12 in Mode-T (15m up, 2m down), and RS-13 in Mode-K (15 up, 10 down).
Note that the two satellites have *different* uplink passbands on 15m,
and they are not connected (audio) to each other.

Greg.

An animal was definitely the first American to orbit the earth. Whether
that one choses to decide that animal was the one belonging to the genus
Pan or _Homo_ is the subject of the rest of the thread. I'll let you
go at it, but at least let's get the biology right. Enos could be called
a chimp, he could also be called a great ape. He could also be called a
non-human primate. Glenn is a great ape, and a human primate.

No pums intended.

Craig

You may want to address this question to Dave Larsen at doc@volcano.net
He's the qsl manager for Mir. I would try to answer but I'm unsure of the
answer. My guess though is it depends on when they do a burn to push their
orbit up a bit. I think the differance in 2-3 weeks is very small unless they
do a burn. Certainly if there's a month's differance people can hang outside
5-10 minutes before predicted time just to be on the safe side.
There may be others here that know the answer better than I. I try to help
whenever I can.

Tom

2530. Balloon payload needed in Michigan

Newsgroup: rec.radio.amateur.space
Date: 1998-11-05 00:00:00 UTC
From: robert@nordhaus.com
Message-ID: <71r964ulb1@nnrp1.dejanews.com>
Source record: 14831
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.space

I'm relatively new to both of these groups but it looks like I've found the right places. If my cross-posting is at all inappropriate, please accept my apologies.

Anyway, I am in the Detroit area and I'm currently working on a few zero-pressure balloon designs. I have flown several dozen small (read: exempt from FAA regs) mylar and HDPE/LDPE prototypes, based mostly on commercial designs and experimental solar/IR balloons designed by JPL and CNES (the French space agency).

Now, why I'm posting here. I'm not a ham (yet -- I plan to take the tech no-code exam in about two weeks) but I would like to fly a GPS payload (and anything else that someone would like to supply, like ATV) in a larger balloon. I'm looking for someone in the area who would be interested in providing the payload and downlink. I will supply the balloon, gas and all flight support, as well as meet FAA requirements.

If this is out of line with amateur rules or something, please let me know. This isn't a commercial project, only a hobby (a strange one, according to my wife) of mine. My ultimate objectives are two-fold: one, to create a low-cost lift vehicle for a rockoon type mission (that's another story) and two, to create a long-duration infrared montgolfiere vehicle for research purposes. I see the latter as being a great platform for a repeater, allowing flights that last for weeks at a time.

If you are interested, please drop me a note. Thanks (and I hope to join you all on the airwaves sometime soon)!

2531. The RS birds

Newsgroup: rec.radio.amateur.space
Date: 1998-11-05 00:00:00 UTC
From: k8kfj@aol.com
Message-ID: <19981105023002.12684.00004097@ng29.aol.com>

Anyone know when RS-12/13 was last in Mode "A"??? <Up on 145 MHz/Down on 29 MHz>. If so, approximately how long it was in that mode?
My problem is....mode KT involves Extra Class frequencies only for the uplink.
Thanks.
73 //Garie *K8KFJ*

Long time ago the Transit navigational satellites used the 150 MHz/400 MHz frequency pair in a Doppler navigational system. The two frequencies were used to compensate for ionospheric disturbances. The Soviet union had a similar system.

I thought that these were made obsolete by the GPS and Glonass systems, but who knows, maybe some satellites from the old system is still operational.

> US Navy transit navigation satellites...

Definitely not. Transit uses:

149.988 399.968 but I am not certain if any of these
are still active as that system is no longer maintained.

Almost certainly you are monitoring the two similar
Russian systems. Frequencies for these are:

149.91 399.76
149.94 399.84
149.97 399.92
150.03 400.09

The second Russian system wheich uses the same sort of signal
has all the birds on a single freq pair:

150.000 400.000

te bothe Russian and US systems tranmsit modulation
on the 150 MHz freqs but only a carrier on the 400 MHz freqs.
Check the corresponding 150 MHz freq when you hear the 400 MHz
freq to confirm the reception of these systems.

Let me add that I'll guarantee any equipment that is flown against flight damage. I should have made that clear in the first post -- I certainly don't expect anyone to risk hundreds of dollars of equipment and have no guarantees.

Michael Ruther wrote:

> What is the uplink/downlink frequencies?
> I thought most of it was in the extra only part(21.200-21.225)
> AA7QA Mike

See below. RS-12 has 15khz in extra and 25khz in advanced. So I
may have exaggerated with "small part", but I have heard only CW [generated by
uplinks] around 21.225 on RS-12 and I prefer SSB [which tends to be
more toward the upper end] so it was never an issue for me, YMMV.

RS-13 is completely outside of extra-only.

(below information lifted directly from AMSAT
http://www.amsat.org/amsat/news/ans.html#rs-12
--thanks amsat!)

RS-12

Uplink 145.910 to 145.950 MHz CW/SSB
Uplink 21.210 to 21.250 MHz CW/SSB
Downlink 29.410 to 29.450 MHz CW/SSB
Downlink 145.910 to 145.950 MHz CW/SSB
Beacon 29.408 MHz
Robot Uplink 21.129 MHz, Downlink 29.454 MHz

Last reported to be semi-operational.

RS-13

Uplink 21.260 to 21.300 MHz CW/SSB
Uplink 145.960 to 146.000 MHz CW/SSB
Downlink 29.460 to 29.500 MHz CW/SSB
Downlink 145.960 to 146.000 MHz CW/SSB
Beacon 29.504 MHz
Robot Uplink 21.140 MHz, Downlink 29.458 MHz

Last reported in mode K.

The RS-12/13 satellite has seen many recent changes in operation during the past
weeks. Modes K, T, KT and simultaneous RS-13 operation
have all been reported by a number of stations.

No official word from the satellite controllers has been received. ANS recommends
monitoring each satellite carefully to determine the
transponder in operation and which mode it is operating in.

Tony, AB2CJ, tells ANS the RS-12 robot is QRV on 21.130 MHz.

RS-12/13 command is now in the hands of Alex Papkov, in Kaluga City, Russia.

I randomly listened and heard a sat on 149.91/399.76, with an rtty-like
modulation on 149.91.
But this is clearly not the same as the 400.1 signal for which I did not
yet find a corresponding signal above 150. But the 400.1 signal is a
bit weaker than the 399.76 and I may have missed it (being wider because
it is modulated, and having some computer QRM on/around 150 MHz).

What is the name of these systems? Maybe I can find the TLEs for these
sats and listen at the appropriate times.

2543. Re: The RS birds

Newsgroup: rec.radio.amateur.space
Date: 1998-11-06 00:00:00 UTC
From: Daniel Zimmerman <zimmerds@clarkson.edu>
Message-ID: <36435C4A.8FCC6F6A@clarkson.edu>
Source record: 14844

RS-12's mode K uplink is from 21.210 to 21.250 MHz. The downlink is
29.410 to 29.450. So that means that there is MORE uplink spectrum in
the Advanced Class portion. In addition, nearly all of the CW activity
thru RS-12 seems to go on below 29.425/21.225 so you do need your Extra
for that.
Hope it helps, and see you on RS-12.

I've been away from the Satellites for about 3 years, but If my
memory is still functioning correctly, the Telstar birds were AT&T
owned...About that time, a lot of the birds were going through a
transition from analog to digital and possibly T4 was one of the
last remaining analog birds to be phased out...Good luck.

I have followed this lead, and it seems to be right.
Orbcomm apparently has licenced the range 400.05 - 400.15 and
the reception of the carrier on 400.1 coincides perfectly with the
passes of Orbcomm satellites.

I have received noise that sounded like data in the 137-138 MHz segment
at the same time.

It remains interesting to know why they send an unmodulated carrier
(I don't hear any modulation or sidebands) on 400.1
Maybe it is modulated when the spacecraft are within groundstation
range?

Anyway, the signal is clearly not related to navigational satellites
that were mentioned (and that I also have received, at least some of
them)

On another news group there was a posting about Telstar4 going dark.
I suspect that some of you guys also work in either TV or
Telecommunications and might have an inside track on this.
Again this is a request for facts, not an attempt to start a scare
story. If only I could remember who "owned" that bird I would try to
find them on the net and ask there.
Please, no flames, if this is a wste of bW why waste more?

Sorry my name is hidden to avoid SPAMBOTS.
May their silicone cores smoke!

NASA forced him to retire, because he was "too old" (14 years younger
than Glenn). And it's Hubble, not Hubbell......

Actually, having been there at the launch and seen the substantial parade of family members walk by, it's Hubble, Hubbell, Hubell...

Once Musgrave's youth is no longer a problem, I'm sure he'll be allowed back...

Is anyone else upset that our tax dollars have been used for a satellite operating in the amateur service for which we cannot access?
I visited the web pages for pansat and they state "please be patient". This has been on the drawing board for the last several years and they are only now getting around to figuring out how the amateurs can use it.
Don't get me wrong, I am all for amateur space satellites and am really enthusiastic about using spread spectrum, I would just like to be included in the "big picture".

Let's see, to date we have one satellite ready to go but can't find a ride to get there and we have another satellite that got there but can't be used by the majority of the amateur satellite operators.......

Hardly seems fair. What do others really think?

Once I have a working prototype, I invite anyone who is interested to consider an Infrared Montgolfiere balloon payload as an alternative to a satellite. The CNES balloons have stayed aloft for months and circled the globe many times. Granted, the LOS isn't as good as satellite, but there's still alot that you could do with it.

A question: is the main interest in amateur satellites simple repeater operation or something more like store-and-forward?

PANSAT was a design and engineering exercise for students at
the Naval Postgraduate School. As such the purpose was primarily to
teach design methodologies and launch a satellite using next
generation protocols. The process provided valuable training for the
students and we get a bird out of it to boot. I consider us to be
very lucky that the transponders are on amateur frequencies rather
than military. It helps them and it helps us. Let's be patient with
them.

I enjoy both! My suggestion would be to use a simple 1200bps AX.25 Packet system with both a mailbox and a digipeater like is aboard the Mir Space Station. This would allow those of us with limited equipment (and funds <grin>) to access and use the system. I think that this would be an excellent project and I wish you good luck with it!

>
The spacecraft itself provides store-and-forward (packet radio)
digital communications using direct sequence spread spectrum
modulation. PANSAT operates in the amateur radio 70 cm band with
center frequency at 436.5 MHz, a bit rate of 9842 bits
per second and 9 MB of message storage. Amateur radio ground stations
will be able to utilize PANSAT via a bulletin-board
type user interface

Well they didn't say when..... I wouldn't look a gift satelite in
the mouth. Be patient
Ed

Radio Meteor Observation Bulletin No. 63 November 1998

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Paseo Bonanova, 8 BARCELONA (02 07'E, 41 24' N)
Frequency: 48.24715 MHz.
Transmitter Location: still working to identify, possibly South German C2,
100 kW, horizontal polarisation)

Antenna: 6-element Yagi 617-6B, 14 dBd gain.
astronomical azimuth 215 deg (=NE), elevation 0 deg.
Antenna: Six element Yagi 617-6B, 14 dBi gain, horizontal polariz.
Azimuth 200 deg (NE), elevation 20 deg
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (500 Hz) and fed into the PC in real time.
Data sampling system: using a super 14 bits A/D card to PC/XT
and "Data Capture" software with 1 second/18 sampling interval
to store all the > 0.5 s reflections.

```

Notes:
. the new location is in the University Ramon llull LA SALLE Enginyeria Arquitectura is ready and I have the collaboration of the Communications Department to improve the system.
Now the radio-city (Barcelona) noise is terrible about 35 dB more than my old location! Also I'm very near to Barcelona TV1 C4.
I tried to receive the C2 in Torrespana (48.25020 MHz) but I have poor reflections and time to time receive the signal by Ionospheric Scatter.

Enric Fraile Algeciras

Observer: Michael Boschat
Location: Halifax, Canada (63 36'W, 44 39'N, 58 meters above sea level)
Listening Frequency: 83.25 MHz
Receiver: Icom R-10
Antenna : resonant dipole
Antenna Direction: Horizontally polarized with lobes in E-W plane, elev 0 deg
Filter : high-Q (Q at least 300) bandpass filter between antenna & receiver.
Listening Mode: AM
Recording method: listening by ear

Notes:
. no corrections for radiant position made to the counts.
. (-) means no observations made.
. Active showers: Draconids maximum on Oct. 8
Epsilon Geminids Oct. 18
Orionids Oct. 21
. equipment problems between Oct 20-28, no data recorded

Mike Boschat

Observer: Giorgio Bressan, Associazione Friulana di Astronomia e
Meteorologia (AFAM)
Location: Remanzacco, near Udine, Italy (13.3 E, 46.1 N)
Antenna: A.) 4 el. Yagi, dir. south
B.) 3 el. Yagi, dir NNE
Frequency: A.) 53.7592 Mhz, USB mode
B.) 49.73885 Mhz, USB mode
Transmitter: A.) TV video carrier, south Italy
B.) TV video carrier, either Praha (NNE) or Budapest (NE)
Observing method: automatic setup using FFTDSP software to record the
total power of the channels A.) and B.). 40 Hz bandwidth
are used for meteor identification, pictures with interference
are manually rejected.

Notes:

. the low values at 14h UT are due to less interference, which resulted in lower counts, while the meteor echoes are still there but not counted by the software during this hour.

. the shape of the Draconids outburst was not symmetric, but showed a slow ascending slope and a faster descending one:

- 10:15 UT: no long meteor reflections
10:15 - 11:15 UT: activity building up, but seems to remain on the same level, Draconids show up as long echos of up to 20 seconds length.
11:50 - 12:50 UT: activity increases very much, long reflections as before.
12:50 - 13:13 UT: highest activity, with the echos overlapping each other.
13:13 - 13:30 UT: fast decrease, echos again up to 20 seconds length
13:30 - 16:10 UT: weak activity, looks same as from 10:15-11:15)

Giorgio Bressan / via Werfried Kuneth

Observer: Eisse Pieter (Peter) Bus
Location: Groningen, Netherlands (6 deg 33' E, 53 deg 13' N)
Frequency: 72.11 MHz
Transmitter Location: Wroclaw, Poland, 130 kW, distance 740 km
Antenna: Yagi, 3 elements, geographical azimuth 106 deg (ESE), elevation 13 deg
Receiver: Bearcat UBC 860 XLT Scanning Radio, sensitivity: 0.5 uV
Observing method: Listening and counting in 5-minute intervals.

Mean "sporadic" activity of 3, 10 and 11 October 1998:
(hourly rates starting at UT)

```
7h 8 9 10 11 12 13 14 17 18 19 20
-----------------------------------------------
91 92 68 84 95 88 68 68 62 59 91 83
```

Long lasting reflections (>1 s):

7h 8 9 10 11 12 13 14 17 18 19 20
---
8 5 6 8

Uncorrected counts observed on October 8, 1998:
(hourly rates starting at UT)

7h 8 9 10 11 12 13 14 17 18 19 20
---
112 89 115 101 181 201 224 92 56 67 85 108

Uncorrected long-lasting reflections >1 s on October 8, 1998.
(hourly rates starting at UT)

7h 8 9 10 11 12 13 14 17 18 19 20
---
12 14 26 35 64 81 75 32 6 6 12 8

Uncorrected long-lasting reflections >1 s on October 8, 1998.
(total reflection-time in minutes)

7h 8 9 10 11 12 13 14 17 18 19 20

0.5 2.0 2.3 1.7 3.7 12.2 11.4 2.3 0.1 0.2 0.3 0.3

Counts per 30-minute intervals corrected for dead-time, "sporadics"
and observability function show for the Draconids a half-wide maximum
at 12h55m UT = solar longitude 195.065 degrees (2000.0).
However, counts per 10-minute intervals show a half-wide maximum at
13h10m UT = solar longitude 195.075 degrees.

Note: between about 12h55m and 13h05m saturation of the signals occurred.
Therefore no individual reflections were counted during this period.
Between about 14h40m and 17h UT interference (probably caused by nearby
computers) obscured the observations.

Peter Bus

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 deg (= E),
elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency

1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB.
SWR of antenna alone at 66.5 MHz: 1.4/1 (good to very good),
measured with MFJ/259P SWR analyzer (HF-VHF 1.8 MHz to 170 MHz)
on Sep 28, 1998.
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

Notes:
. ? probably affected by sporadic-E, direct reception.
. thunderstorm on Oct 23-24, storm on Oct 24-25.
. * warning for relative high number of long duration reflections,
an indication for potential stream activity.
. switch to winter hour (local time = UT + 1 hours) on Oct 25

Maurice De Meyere

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 20 deg
Antenna amplifier: 10 dB gain
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

Notes:
. hardly any Draconids activity noticeably, probably due to unfavourable geometrical conditions!
. Orionids maximum on Oct 22

Pierre De Groote

Observer: Will Kelsey
Location: Santa Maria, CA. USA (120 26' 9" W, 34 55' 58" N)
Frequency: 98.5 MHz
Transmitter Location: Sacramento, CA. KRAK FM, 50 kW at 362 km.
Antenna: Yagi FM 6 element. Heading North
Receiver: Sangean 803 A
Observing Method: Listening to audio recording.

Underdense/Overdense Scale:
C-Dense: 0.5 second or less
B-Dense: 0.5 to 3.0 seconds
X-Dense: 3.0 seconds or more

Estimated Signal Amplitude (ESA): 1 to 99 maximum
Interference (INT): Lo Med Hi

Each observation hour is recorded in three 20 minute intervals

Will Kelsey

Observer: Werfried Kuneth
Location: Ferndorf, Austria (13 37' E, 46 45' N)
Antenna: 2 element Yagi, direction southeast, no elevation at 1m height.
Receiver: IC-706 at 53.76065 MHz, CW-R mode, 500 Hz CW filter, fast AGC.
Transmitters: 1) 30 kW TV video carrier from Bari, Italy, distance 700 km,
direction south and 2) a 30 kW TV video carrier from Sicilia,
Italy, distance 900 km, south. The total echo power of both
transmitters is processed into same 40 Hz virtual
receiver channel.
Observing method: automatic setup using FFTDSP42t software by AF9Y to record
the audio signal. 20 channels of 2 Hz width are used for meteor
identification, pictures with interference, are manually rejected.
Sampling interval: one 4096 point FFT every 0.5 seconds.

The meteor counts below are corrected for a full hour observing time. If
the recording duration is 20-40 minutes, a dot is shown after the value, to
show the reduced accuracy. Results for less than 20 min. observing time are
excluded.

Counts of reflections longer than 6.5 seconds,
assumed to be overdense.

Notes:
. looking at the whole month of October 1998, the Draconids outburst is the biggest event. The Orionids showed a broad peak of activity lasting for several days with no special peak observed, as in previous years.

Werfried Kuneth

Observer: Ton Schoenmaker
Location: Roden, Netherlands (06 26' E, 53 08' N)
Frequency: 77.257 MHz
Transmitter: Kielce, Poland; 100 kW, horizontal polarization
Antenna: 4-element horizontal Yagi, geographical azimuth 105 degrees (ESE), elevation 15 degrees
Receiver: home-made convertor followed by Barlow-Wadley XCR-30 Mark II; total sensitivity 0.3 uV for 20 dB S/N, bandwidth 3 kHz
Observing: rectified signal from 455 Khz I.F. recorded with a Servogor strip-chart recorder with a chart speed of 120 mm/hour

Observations of the Draconids started at 12h19m UTC when the TV transmitter in Kielce was switched on. Immediately many reflections were recorded. At the 0.12 uV level signals were nearly overlapping, signals of 0.3 uV or stronger could be separated most of the time. In contrast with the outbursts of Leonids 1997 and so-called new peak of the Perseids, not many long-lasting echoes were present. The longest reflections lasted about 1 minute. The recordings show that the peak of stronger signals preceded the peak of weaker signals by about 15 - 30 minutes.

The following table gives the uncorrected counts of signals stronger than 0.3 uV (column "A") and counts of signals stronger than least 0.12 uV (column "B"), converted into hourly rates.
Observations of 10 October are presumed to be sporadics mainly.

Hourly rates for the indicated intervals:

. I caught the Giacobinids activity, see:
http://www2s.biglobe.ne.jp/~JN-/Gia98.GIF

Chikara Shimoda

Observer: Ilkka Yrjola
Location: Finland (26 35' E, 60 54' N)
Frequency: 88.8 MHz ?
Receiver: Salora SRP-22 modified, narrow band FM (B=15 kHz)?
detected signal level >-122 dBm.
FM detection, no pulse noise rejection required.
Antenna: 2-el. Yagi, G=4 dBd to SW, azimuth 45 deg (SW), polarisation H.
Data sampling system: threshold triggering, sampling rate 32 ms.
Computer logs total hourly elapsed reflection time, number of
triggers for the hour, the longest time the signal was
continuously above detection level for the hour.
Data on major showers available in the Compact MS-Soft format.
Software for viewing available from
www.saunalahti.fi/~oh5iy/radio50.zip (754 K).

The Orionids 1998 observations are made with a temporary setup and the number
of reflections is unfortunately not directly comparable with older data.

Notes:
. the numbers (n) are hourly rates, but calculated per half hour. They are corrected for dead time and breaks.
. The sporadics (spor) are based on observations in the past during several years. Fobs is the Hines' observability function, as described in Canadian Journal of Physics (Vol.33, September 1955, number 9, pag 493-503).
This probability function is not always sufficient when the radiant is close to the zenith, as is also the case now with the Draconids 1998. Peter Bus, Ton Schoenmaker and myself are working on an alternative.

Wim Zanstra

2. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and it has gradually been expanded. In regularly publishing summaries of observations, potential radio observers are kept up to date of existing installations, possibilities and limitations of radio meteor observations. In the long run, there should be sufficient observing stations to cover the whole globe, allowing to detect stream outbursts which may remain unnoticed visually.

RMOB contains typically: summaries of recent observations, equipment data, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or un-subscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

3. ANNOUNCEMENT

Pierre Terrier <pierre.terrier@wanadoo.fr> is the author of Meteor 2.0, a PC program designed for automatic meteor reflections registration. It uses a special small interface card, which can be used on machines as small as a 286 (no sound card required). The circuit causes very little interference on the RF part. The program and its documentation, as well the circuit description can be found at:

http://members.tripod.com/~astro_electronic/

(in French and in English)

2562. Radio Meteor Obs. Bul. Oct 1998 Draconids

Newsgroup: rec.radio.amateur.space
Date: 1998-11-09 00:00:00 UTC
From: Chris Steyaert <72650.3513@CompuServe.COM>
Message-ID: <#w7so56C#GA.180@ntdwwaaw.compuserve.com>
Source record: 14714

Radio Meteor Observation Bulletin No. 63 November 1998

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Enric Fraile Algeciras
Location: Paseo Bonanova, 8 BARCELONA (02 07'E, 41 24' N)
Frequency: 48.24715 MHz.
Transmitter Location: still working to identify, possibly South German C2,
100 kW, horizontal polarisation)

Antenna: 6-element Yagi 617-6B, 14 dBd gain.
astronomical azimuth 215 deg (=NE), elevation 0 deg.
Antenna: Six element Yagi 617-6B, 14 dBi gain, horizontal polariz.
Azimuth 200 deg (NE), elevation 20 deg
Receiver: home made converter 20 dB gain, 1 dB noise and Kenwood TS-830S.
10 dB attenuator in the receiver to reduce direct reception
Sensitivity: 0.25 uV for 10 dB S/N
Observing method: the audio signal of the video carrier is received using
a narrow CW filter (500 Hz) and fed into the PC in real time.
Data sampling system: using a super 14 bits A/D card to PC/XT
and "Data Capture" software with 1 second/18 sampling interval
to store all the > 0.5 s reflections.

```

Notes:
. the new location is in the University Ramon llull LA SALLE Enginyeria Arquitectura is ready and I have the collaboration of the Communications Department to improve the system.
Now the radio-city (Barcelona) noise is terrible about 35 dB more than my old location! Also I'm very near to Barcelona TV1 C4.
I tried to receive the C2 in Torrespana (48.25020 MHz) but I have poor reflections and time to time receive the signal by Ionospheric Scatter.

Enric Fraile Algeciras

Observer: Michael Boschat
Location: Halifax, Canada (63 36'W, 44 39'N, 58 meters above sea level)
Listening Frequency: 83.25 MHz
Receiver: Icom R-10
Antenna : resonant dipole
Antenna Direction: Horizontally polarized with lobes in E-W plane, elev 0 deg
Filter : high-Q (Q at least 300) bandpass filter between antenna & receiver.
Listening Mode: AM
Recording method: listening by ear

October 1998

Number of meteors heard in one hour interval

Notes:
. no corrections for radiant position made to the counts.
. (-) means no observations made.
. Active showers: Draconids maximum on Oct. 8
Epsilon Geminids Oct. 18
Orionids Oct. 21
. equipment problems between Oct 20-28, no data recorded

Mike Boschat

Observer: Giorgio Bressan, Associazione Friulana di Astronomia e
Meteorologia (AFAM)
Location: Remanzacco, near Udine, Italy (13.3 E, 46.1 N)
Antenna: A.) 4 el. Yagi, dir. south
B.) 3 el. Yagi, dir NNE
Frequency: A.) 53.7592 Mhz, USB mode
B.) 49.73885 Mhz, USB mode
Transmitter: A.) TV video carrier, south Italy
B.) TV video carrier, either Praha (NNE) or Budapest (NE)
Observing method: automatic setup using FFTDSP software to record the
total power of the channels A.) and B.). 40 Hz bandwidth
are used for meteor identification, pictures with interference
are manually rejected.

Notes:

. the low values at 14h UT are due to less interference, which resulted in lower counts, while the meteor echoes are still there but not counted by the software during this hour.

. the shape of the Draconids outburst was not symmetric, but showed a slow ascending slope and a faster descending one:

- 10:15 UT: no long meteor reflections
10:15 - 11:15 UT: activity building up, but seems to remain on the same level, Draconids show up as long echos of up to 20 seconds length.
11:50 - 12:50 UT: activity increases very much, long reflections as before.
12:50 - 13:13 UT: highest activity, with the echos overlapping each other.
13:13 - 13:30 UT: fast decrease, echos again up to 20 seconds length
13:30 - 16:10 UT: weak activity, looks same as from 10:15-11:15)

Giorgio Bressan / via Werfried Kuneth

Observer: Eisse Pieter (Peter) Bus
Location: Groningen, Netherlands (6 deg 33' E, 53 deg 13' N)
Frequency: 72.11 MHz
Transmitter Location: Wroclaw, Poland, 130 kW, distance 740 km
Antenna: Yagi, 3 elements, geographical azimuth 106 deg (ESE), elevation 13 deg
Receiver: Bearcat UBC 860 XLT Scanning Radio, sensitivity: 0.5 uV
Observing method: Listening and counting in 5-minute intervals.

Mean "sporadic" activity of 3, 10 and 11 October 1998:
(hourly rates starting at UT)

```
7h 8 9 10 11 12 13 14 17 18 19 20
-----------------------------------------
91 92 68 84 95 88 68 68 62 59 91 83
```

Long lasting reflections (>1 s):

7h 8 9 10 11 12 13 14 17 18 19 20
---
8 5 6 8

Uncorrected counts observed on October 8, 1998:
(hourly rates starting at UT)

7h 8 9 10 11 12 13 14 17 18 19 20
---
112 89 115 101 181 201 224 92 56 67 85 108

Uncorrected long-lasting reflections >1 s on October 8, 1998.
(hourly rates starting at UT)

7h 8 9 10 11 12 13 14 17 18 19 20
---
12 14 26 35 64 81 75 32 6 6 12 8

Uncorrected long-lasting reflections >1 s on October 8, 1998.
(total reflection-time in minutes)

7h 8 9 10 11 12 13 14 17 18 19 20

0.5 2.0 2.3 1.7 3.7 12.2 11.4 2.3 0.1 0.2 0.3 0.3

Counts per 30-minute intervals corrected for dead-time, "sporadics"
and observability function show for the Draconids a half-wide maximum
at 12h55m UT = solar longitude 195.065 degrees (2000.0).
However, counts per 10-minute intervals show a half-wide maximum at
13h10m UT = solar longitude 195.075 degrees.

Note: between about 12h55m and 13h05m saturation of the signals occurred.
Therefore no individual reflections were counted during this period.
Between about 14h40m and 17h UT interference (probably caused by nearby
computers) obscured the observations.

Peter Bus

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.47 Viesintos Lithuania 12 05h00-22h00
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 04h30-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 deg (= E),
elevation 27 deg.
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency

1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB.
SWR of antenna alone at 66.5 MHz: 1.4/1 (good to very good),
measured with MFJ/259P SWR analyzer (HF-VHF 1.8 MHz to 170 MHz)
on Sep 28, 1998.
Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

October 1998

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

Notes:
. ? probably affected by sporadic-E, direct reception.
. thunderstorm on Oct 23-24, storm on Oct 24-25.
. * warning for relative high number of long duration reflections,
an indication for potential stream activity.
. switch to winter hour (local time = UT + 1 hours) on Oct 25

Maurice De Meyere

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 20 deg
Antenna amplifier: 10 dB gain
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anti-coincidence measurement rejects
registration of broadbanded spurious signals (lightning, computers,
ignition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic-E.

```

Notes:
. hardly any Draconids activity noticeably, probably due to unfavourable geometrical conditions!
. Orionids maximum on Oct 22

Pierre De Groote

Observer: Will Kelsey
Location: Santa Maria, CA. USA (120 26' 9" W, 34 55' 58" N)
Frequency: 98.5 MHz
Transmitter Location: Sacramento, CA. KRAK FM, 50 kW at 362 km.
Antenna: Yagi FM 6 element. Heading North
Receiver: Sangean 803 A
Observing Method: Listening to audio recording.

Underdense/Overdense Scale:
C-Dense: 0.5 second or less
B-Dense: 0.5 to 3.0 seconds
X-Dense: 3.0 seconds or more

Estimated Signal Amplitude (ESA): 1 to 99 maximum
Interference (INT): Lo Med Hi

Each observation hour is recorded in three 20 minute intervals

Will Kelsey

-------------------------------------------------------------------------
Observer: Werfried Kuneth
Location: Ferndorf, Austria (13 37' E, 46 45' N)
Antenna: 2 element Yagi, direction southeast, no elevation at 1m height.
Receiver: IC-706 at 53.76065 MHz, CW-R mode, 500 Hz CW filter, fast AGC.
Transmitters: 1) 30 kW TV video carrier from Bari, Italy, distance 700 km,
direction south and 2) a 30 kW TV video carrier from Sicilia,
Italy, distance 900 km, south. The total echo power of both
transmitters is processed into same 40 Hz virtual
receiver channel.
Observing method: automatic setup using FFTDSP42t software by AF9Y to record
the audio signal. 20 channels of 2 Hz width are used for meteor
identification, pictures with interference, are manually rejected.
Sampling interval: one 4096 point FFT every 0.5 seconds.

The meteor counts below are corrected for a full hour observing time. If
the recording duration is 20-40 minutes, a dot is shown after the value, to
show the reduced accuracy. Results for less than 20 min. observing time are
excluded.

Counts of reflections longer than 6.5 seconds,
assumed to be overdense.

```

The Draconids outburst peak occured here at 12:50 to 13:20 UT, and there was good activity from 11:50 to 13:50 UT.

Propagation overview for October 1998

E : sporadic-E or E-layer propagation
F : FAI (field aligned irregularity)
- : propagation only via meteor echos.
(blank) : no data available

Notes:
. looking at the whole month of October 1998, the Draconids outburst is the biggest event. The Orionids showed a broad peak of activity lasting for several days with no special peak observed, as in previous years.

Werfried Kuneth

Observer: Ton Schoenmaker
Location: Roden, Netherlands (06 26' E, 53 08' N)
Frequency: 77.257 MHz
Transmitter: Kielce, Poland; 100 kW, horizontal polarization
Antenna: 4-element horizontal Yagi, geographical azimuth 105 degrees (ESE), elevation 15 degrees
Receiver: home-made convertor followed by Barlow-Wadley XCR-30 Mark II; total sensitivity 0.3 uV for 20 dB S/N, bandwidth 3 kHz
Observing: rectified signal from 455 Khz I.F. recorded with a Servogor strip-chart recorder with a chart speed of 120 mm/hour

Observations of the Draconids started at 12h19m UTC when the TV transmitter in Kielce was switched on. Immediately many reflections were recorded. At the 0.12 uV level signals were nearly overlapping, signals of 0.3 uV or stronger could be separated most of the time. In contrast with the outbursts of Leonids 1997 and so-called new peak of the Perseids, not many long-lasting echoes were present. The longest reflections lasted about 1 minute. The recordings show that the peak of stronger signals preceded the peak of weaker signals by about 15 - 30 minutes.

The following table gives the uncorrected counts of signals stronger than 0.3 uV (column "A") and counts of signals stronger than least 0.12 uV (column "B"), converted into hourly rates.
Observations of 10 October are presumed to be sporadics mainly.

Hourly rates for the indicated intervals:

| October 1998

Chikara Shimoda

Observer: Ilkka Yrjola
Location: Finland (26 35' E, 60 54' N)
Frequency: 88.8 MHz ?
Receiver: Salora SRP-22 modified, narrow band FM (B=15 kHz)?
detected signal level >-122 dBm.
FM detection, no pulse noise rejection required.
Antenna: 2-el. Yagi, G=4 dBd to SW, azimuth 45 deg (SW), polarisation H.
Data sampling system: threshold triggering, sampling rate 32 ms.
Computer logs total hourly elapsed reflection time, number of
triggers for the hour, the longest time the signal was
continuously above detection level for the hour.
Data on major showers available in the Compact MS-Soft format.
Software for viewing available from
www.saunalahti.fi/~oh5iy/radio50.zip (754 K).

The Orionids 1998 observations are made with a temporary setup and the number
of reflections is unfortunately not directly comparable with older data.

Notes:
. the numbers (n) are hourly rates, but calculated per half hour. They are corrected for dead time and breaks.
. The sporadics (spor) are based on observations in the past during several years. Fobs is the Hines' observability function, as described in Canadian Journal of Physics (Vol.33, September 1955, number 9, pag 493-503).
This probability function is not always sufficient when the radiant is close to the zenith, as is also the case now with the Draconids 1998. Peter Bus, Ton Schoenmaker and myself are working on an alternative.

Wim Zanstra

2. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and it has gradually been expanded. In regularly publishing summaries of observations, potential radio observers are kept up to date of existing installations, possibilities and limitations of radio meteor observations. In the long run, there should be sufficient observing stations to cover the whole globe, allowing to detect stream outbursts which may remain unnoticed visually.

RMOB contains typically: summaries of recent observations, equipment data, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or un-subscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

3. ANNOUNCEMENT

Pierre Terrier <pierre.terrier@wanadoo.fr> is the author of Meteor 2.0, a PC program designed for automatic meteor reflections registration. It uses a special small interface card, which can be used on machines as small as a 286 (no sound card required). The circuit causes very little interference on the RF part. The program and its documentation, as well the circuit description can be found at:

http://members.tripod.com/~astro_electronic/

(in French and in English)

2563. sensitivity for receiving sats?

Newsgroup: rec.radio.amateur.space
Date: 1998-11-09 00:00:00 UTC
From: NOSPAMnocoast@aol.com
Message-ID: <36475c72.632316@netnews.worldnet.att.net>
Source record: 14715

Howdy,

I have tried to receive the 29.357 downlink beacon from
RS-10 but didn't hear anything. My Ten-Tec rig
is rated at a 1 uV sensitivity, and I have a 10M dipole
15 feet up.

Should I be able to receive the beacon or do I need
a pre-amp?

Be patient?

As I recall, this satellite was on the drawing board in 1996 or so. That makes it almost 3 years for them to figure out the amateur ground station.

Don't get me wrong, I am happy that it is up there, just wish there had been more participation/information for the users!

I was wondering what all I could do with my Yaseu FT50R, a 5/8 wavelength antenna (2m) and a 2m 4 element beam.

I've tried receiving 137 mhz weather images with Wxsat (sound blaster decoding program) but they end up all white or very washed out (I don't think the volume is too loud, it falls within range at all times during the "Test" section). Also, there are about a dozen different ways of decoding the signal for the differnet images for the NOAA series, russian ones, etc which are really frustrating....

Can anybody give me some info/advice?

Thanks!

While I am not an RS-10 expert, I don't think you need a preamplifier. You may have an elevated noise level at your QTH or the sattelite elements (KEPS, TLE's) that you are using have expired. Make sure your satellite program has the latest data and be sure the clock is set properly. You might check the AMSAT bulletins to make sure the RS-10 beacon is working.

I am able to receive the RS birds on 10 meters with a G5RV antenna and no preamplifier.

2567. Element Manager

Newsgroup: rec.radio.amateur.space
Date: 1998-11-10 00:00:00 UTC
From: rickvg@usa.net
Message-ID: <3649c327.15860213@news.pcisys.net>
Source record: 14719

I recently received a request from a user of an old DOS program I wrote years ago, Element Manager. He had a complaint. The program would only deal with files that contained less than 1000 element sets. In response to his request, I've rewritten the program in the Windows environment.

Element Manager for Windows is a 32 bit Visual Basic 5 program. It requires Windows 95/98 or NT to operate. You'll also need the VB5 runtime files. Links to the runtime files are available on the Download page.

Element Manager can now load the entire NORAD catalog (8000+ satellites).

It can then sort the file by most of the parameters in an element set.

It can select out satellite element via selection criteria including, mean motion, decay, inclination, eccentricity, perigee, apogee and age. There are minimim and maximum settings for each of these except age. That can only be selected by a single value. Any satellites with element sets which are "younger" than the number of days set for age will be selected.

The program can use select files. You can create files containing norad catalog numbers and satellite names. When you load a select file and activate it, only satellites which appear in your select file will be displayed.

Once these selections have been made, you can export a new element file containing only those satellites that match your selection criteria.The export file will appear in the same order as any sort you apply to it in the program.

Element Manager reads in just about any DOS format text file and extracts element sets. As long as line 1 and line 2 of the element set are intact, ie: 69 characters from the first character to the last, and match certain other criteria, then regardless of what preceeds them or follows them, they will be picked out and loaded. Indented 2 line elements are fine.

If the satellite name (line 0) is blank, or longer than 40 characters, Element manager will consult a special file (satname.dat) to see if there is a match for the NORAD catalog number. If there is, the program will substitute the name found in satname.dat for the badly formatted name in the import file.

If there is no match, then the program will fabricate a satellite name by using the International Launch Designation data. If there is no ILD data, the norad catalog number will be used as the name.

Hmmm, I'm getting too detailed for usenet, so:

If you're interested in the program visit:

http://www.eoss.org/elementmanager/

There is a fairly respectable web page that describes the program fullly and shows some screen shots of the various screens.

Bug reports and suggestions are welcome.

What amateur equipment is available to work spread spectrum in the
70cm band?

Maybe someone can make a black box that will work with any radio as a
front-end thing to our current radios?

It was my understanding that, as amateurs, we were not allowed to use spread spectrum technology? Am I to understand that we can do spread spectrum?

Depends on what country you live in. Amateur spread spectrum is
closely regulated (or banned outright) in some countries. Here
in VE-land we can do more or less as we please.

As for the grumbling about the signal formats, all the necessary
information is on the PANsat web site: 9.842 kbps, direct sequence,
1.25 million chips per second, 7 stages with taps at 1 and 7,
436.5 MHz. What more do you need?

Check Electronics World (U.K.) from the latter half of 1993 for a
fully worked out 70 cm SS radio that would, with trivial modifi-
cations, be compatible with PANsat.

Visible NOAA images look washed out, and IR images look black until you
tinker with them. You have to mess with them separately, because
the images have very different dynamic ranges.

NOAA-15 sometimes seems to send blank (i.e. all white) images. You don't
need a computer to tell when this is happening. You can hear it.

Sorry, I can't help you with WXsat settings - I use my own program.

You don't need a pre-amp but without one the signal is low but audible.
Mast mounted pre-amps are usually recommended for the RS birds.

Weather satellites use an FM deviation that is incompatible with commercial
amateur radio transceivers. The NBFM filters are too narrow, the WFM
filters are too wide.
Optimal reception of these satellites requires a dedicated receiver, or
at least a modified receiver (extra filter fitted).

in VE-land we can do more or less as we please.
[Laura Halliday VA3LDH]

Actually, the PANSAT folks were one of the first to get an STA
[Special Temporary Authorization (or something like that)] to
operate spread spectrum in modes other than permitted by Part 97
[FCC regs], in part, to develop the technology to communicate with
PANSAT once it launched. Look at their website for details on the
STA and the encoding that they're using.

Alex,
I think your main problem is the bandwidth of your receiver. To receive a NOAA or MET class satellite your receiver must have a bandwidth of about 40 kHz. Ordinary FM receivers used for 2m communication are much too narrow.

I do not recommend to modify your receiver unless you have pretty old one which you don't use
for anything else. In that case replace the crystal filter in the IF stage against onother one
of about 38...45kHz. If you can't get one you might also replace it against a 100 nF capacitator
which will make the bandwidth much wider but in that case wider is better than too small.

You might also get or build one from a kit.

BTW I use one from HamTronics, R139, the kit was about $160 or so.

Hope that helps
...Lothar

Yes, we are allowed to do spread spectrum. The limitations on its use are pretty severe, but the PANSAT uses one of the spreading sequences we are permitted to use.

See the Spread Spectrum Sourcebook for designs you can build.

>Maybe someone can make a black box that will work with any radio as a
>front-end thing to our current radios?

There's such a circuit in the referenced volume. Trying to kludge an
existing analog radio isn't the right way to do it, however.

2581. monitor inmarsat/sarsats ?

Newsgroup: rec.radio.amateur.space
Date: 1998-11-11 00:00:00 UTC
From: IK <ian@koengimedia.demon.co.uk>
Message-ID: <910757702.14947.0.nnrp-06.c2dee24a@news.demon.co.uk>
Source record: 14733

Hi all,
May seem like a silly question but is it possible to listen to anything on inmarsat or the sarsats with a scanner that goes up to 1.6ghz?

thanks in advance for any info

IK

The FCC allows hams to operate spread spectrum under an indefinite STA. See the article on the AMSAT web page under PANSAT for details.

Akha Zauh: Journal of the Golden Triangle

****

From here on the Burmese border at Maesai.

****

Medical, Endangered Language work, Clean water Systems, Advocacy.

****

Dear Friends:

We have managed to raise $3000 of the $9000 toward the pay off of our
4x4 ambulance.

Anyone who can further assist please jump up and shout.

We are getting down to the wire.
Banking information at the bottom of this email.
This project survives on donations from our friends only.
We are not a "funded" project.

This ambulance is urgently needed to move Akha from the Burmese border
areas to the hospitals as well as a 24 hour call service to Akhas in the
mountains in Northern Thailand to take them to medical facilities. At
this time there is no such service to over 60,000 Akha in some 250
villages.
Many mobile phones are out on the roads now though, and by setting up
call stations we can make great improvement in our fight against infant
mortality.

Please visit akha.com for more about our work.

Thankyou for your support,

Matthew McDaniel

Yes, but you will need a directional antenna. E.g. 2 or 4 stacked helices,
or a small dish. Preferably with a preamp mounted directly at the antenna.
An omni won't cut it.

Hi,

just heard the sigs of Sputnik 41 - obviously just launched from the MIR. Freq 145.812 +/- doppler, FM, voice messages and beeps and long beep, date 11-Nov-1998, time 0305-0312, RST 519. Received in Muenster (JO31SX), NW Germany. During this pass the MIR had an maximum elevation of 85,3 deg, range = 375 km, travelling almost exactly from west to east.

SB SPACE ARL ARLS015
ARLS015 Sputnik 41/RS-18 Launched from Mir

Russian cosmonauts launched another mini-Sputnik satellite November 10 during a spacewalk from the Mir space station. The launch of Sputnik 41--also being called RS-18--comes just over a year after the launch of Sputnik 40, which commemorated the launch of the first artificial Earth satellite by the USSR in 1957.

Among the first in the US to report hearing the new satellite was Ken Carlstrom, N1WED, in New Hampshire. He reported hearing Sputnik 41 November 11 from approximately 0604 to 0609 UTC on 145.8145 MHz.

The Sputnik had arrived on Mir aboard a Progress supply rocket late last month. Sputnik 41 was financed by the Aeroclub de France to mark its centennial as part of a program of satellites made in a collaboration of Russian and French students. AMSAT-France is cooperating with the education department of the Russian Aeronautic Federation to make this latest Sputnik reprise possible.

Sputnik 41 broadcasts pre-recorded voice greetings in three languages, French, English, and Russian. The messages say ''1998 was the International Year of Air and Space'' and ''International Space School Sputnik Program.'' The French and Russian messages convey the same greetings.

Sputnik 41 is the same size as Sputnik 40--just under 8 inches in diameter and weighing almost 9 pounds. It carries a 200 mW transmitter that transmits on or about 145.812 MHz (+/- 5 kHz and Doppler shift). The spacecraft has no solar cells. Its expected operational lifetime is approximately 30 days.

The new spacecraft also has a beacon. The frequency of the audio tone indicates the satellite's internal temperature. The tone is transmitted every 90 seconds.

Sputnik 41 reception reports go to AMSAT-France, QSL Spoutnik 41, 14 bis rue des Gourlis, F-92500 Rueil-Malmaison, FRANCE. The 1998 International Year of Air and Space page is at http://www.ccr.jussieu.fr/physio/Satedu/sputnik41.html.

2589. Leonid Meteor Shower

Newsgroup: rec.radio.amateur.space
Date: 1998-11-11 00:00:00 UTC
From: treynolds@my-dejanews.com
Message-ID: <72d7o6$j7s$1@nnrp1.dejanews.com>
Source record: 14741

Does anyone know when will be the best time to attempt meteor scatter QSOs during the Leonid meteor shower next week? I have the following info from sci.space.news: "The peak time for the Leonid meteor shower will be November 17, sometime between 11:43 A.M. and 5:43 P.M. EST". I would imagine that the period of peak meteor activity is also the best period to attempt communications. But I am a rookie at all this so any advice would be appreciated.

Thanks in advance,
Tom

Source record: 14742

Appx 2am uk time i heard very faintly a voice that was sort of "announcement like" i quickly checked with my logsat orbit prediction programme and MIR had only just gone over me by about 1 minute so is it possible that i picked up the 200mwt signal from this hand launched satellite (bear in mind i was using a ar8000 scanner and a large external antenna). it seems a bit of a coincidence that i heard a short amount of voice like that at the same time MIR was coming over !. and i was also on the correct freq for this satellite too (145.812)

did anybody else in the UK or nerby get this at this time also ?

look forward to hearing from you

Well the late nighter was worth it, at 03.36am 12/11/98 i started to receive the voice messages from the hand launched sputnick satellite launched from mir by a cosmanought. it started to come through about 2 mins after the packet transmissions from mir wet quite on me. what makes me so surprised is that it it is only using 200 mwatt power and i picked it up extremely clear for at least 1 minute out of the 4 mins i had it in contact using just an AR8000 hand held scanner and a length of wire outside my window !.
i have a real audio recording of it at my website
http://www.koenigmedia.demon.co.uk
the site wont be there long as my account has been cancelled by me so excuse me if it is not there when you go.

Ah well, thats one for my books, getting that makes my hobby worthwhile, i was junping about like a bloody schoolboy ! :-)

seeya all !

Not at this time, but when MIR passed over London around 06:45 UTC,
the signals of the RS-18 (or how it is called) were well audible
when received with a simple dipole for 2 m although it was a rather
low pass according to the predictions (see
http://acsprod1.acs.ncsu.edu/scripts/HamRadio/sattrack).

They have done a nice job. I wonder whether it were possible to launch
more small amateur radio satellites this way? Maybe even a transponder
or relay station? Of course, they would be rather short-lived, especially
if powered by batteries, but they'd probably be rather cheap - good for
experiments!

When they will have abandoned the old space station in favour of the
new one, maybe one could keep the ham radio gear aboard MIR in use as
an automatic station until re-entry?

Just some crazy ideas ...

Just a reminder that there are quite a few nice ham radio
equipped balloon launches slated for November. Among the following
four events you can find slow and fast scan TV, APRS, and repeaters.

This is getting toward the end of the balloon season, and a few
of these November events are due to October postponements.
At this time of year especially, weather can cause delays or
total scrubs, so if you're interested in participating bear in
mind that cancellations are not unusual.

All of these events are listed in detail in the HABLIC website
listed below, and at the respective launch group websites.
HABLIC strives to list, in one convenient location, all amateur
radio balloon launches in North America, and occasionally has items
from South America and Europe.

Hi Tom -- can't answer your question directly -- however I wonder if you
have seen the Meteor Scatter pages at URL:
http://www.ac6v.com/pagew.html#MS

Lots of good info on operting procedures.

>too (145.812)

99.999pc probability :) Well done.

I heard, and managed to record, the announcement which is in three
languages, French, English and Russian. I caught the 00.25UTC (approx)
pass on 145.8125 using an FT3000 2m FM rig with a triband vertical. That
pass was lower in the sky so it wasn't brilliant reception. Fell asleep
before the 02.00 pass!! My MVT7100 on an indoor 2 band vertical
received nothing at that time.

I'm on the lookout for some keps now for RS18 (Sputnik 41) as it will
gradually move away from MIR as the last one did.

Not at this time, but when MIR passed over London around 06:45 UTC,
the signals of the RS-18 (or how it is called) were well audible
when received with a simple dipole for 2 m although it was a rather
low pass according to the predictions (see
http://acsprod1.acs.ncsu.edu/scripts/HamRadio/sattrack).

They have done a nice job. I wonder whether it were possible to launch
more small amateur radio satellites this way? Maybe even a transponder
or relay station? Of course, they would be rather short-lived, especially
if powered by batteries, but they'd probably be rather cheap - good for
experiments!

When they will have abandoned the old space station in favour of the
new one, maybe one could keep the ham radio gear aboard MIR in use as
an automatic station until re-entry?

Just some crazy ideas ...

The November issue of Monitoring Times has an article, "Inmarsats and how to hear them live". Frequencies between 1535.0 to 1543.5 MHz, but it looks like you'll need a helix or small dish and maybe a low-noise preamp.

:> communications. But I am a rookie at all this so any advice would be
:> appreciated.

I'm a rookie as well but have done months of research in prep for this. :)
The
best time is always between midnight and 6am local time. This is because
your side
of the earth faces the meteor field(s) head on during those hours. The US is
not
expected to see any of the storm levels Asia may get, however it should
still be
quite a show. If you are looking for QSOs in particular then I'd point west
of your
location. Again, I'm new to this too so you mileage may vary!

Have a look at
http://www.ccr.jussieu.fr/physio/Satedu/sputnik41.html -
there you will find that RS-18 is an improved version
of RS-17 (which was the model sputnik they had launched
1 year ago in order to celebrate 40 years of artificial
Earth satellites). There is no uplink, it simply transmits
on 145.812 MHz in FM (pre-recorded voice and "beeps").

Cross-posted to: alt.dbs.echostar,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.space,rec.radio.scanner,rec.radio.swap,sci.electronics.components

I have a box of new KU Band LNB's. Input frequency is 11.7 to 12.2 GHz and output is 950-1450. Units are new in the box. The units are conservatively rated at 1.2dB NF. These are high quality units with guaranteed Noise figure performance. Most LNB's out there are rated at .7 dB, but really have 1.0++ NF. These units use a DRO module at 10.75 GHz. The module can be easily removed. I have soldered an SMA cable where the module was located to insert a different LO. With minor tuning I got them to receive great at 10 GHz.

I will sell them for $30 each or 5 for $105 including shipping. These LNB's produce perfect P5 pictures on most birds with a simple 3 foot dish antenna.

2620. Re: monitor inmarsat/sarsats ?

Newsgroup: rec.radio.amateur.space
Date: 1998-11-13 00:00:00 UTC
From: Dana.Gould@gn5.gratisnet.com
Message-ID: <wgcid$$3cNG00$i72h7f4$248a4$241$knews-1$inews$igte$inet$3e$j0000025c@gratisnet.com>
Source record: 14622

The November issue of Monitoring Times has an article, "Inmarsats and how to hear them live". Frequencies between 1535.0 to 1543.5 MHz, but it looks like you'll need a helix or small dish and maybe a low-noise preamp.

Hi,

I'm looking for informations about the Hurricane 350, HF mobile amplifier.

Where can I find informations about this old amplifier.

Thanks in advance and best 73.

HB9ICC Sebastien

2622. A message to all V.E.'s regarding restructuring.

I hate the ARRL proposal. If the ARRL proposal is accepted by the FCC, this

VE is going to resign and turn in his badge. I won't participate in the
dumbing down of amateur radio.

Are there any other V.E.'s with honnor and integrity who would be
willing
to join with me?

Save CW

I'll add that you will only have about 20 days to a month to hear RS-18. It has no solar cells.

2625. FS KU Band LNB's NEW CHEAP!

Newsgroup: rec.radio.amateur.space
Date: 1998-11-13 00:00:00 UTC
From: Pieter.Ibelings@gn5.gratisnet.com
Message-ID: <wgcid$$3cNG00$i72ilk3$24121$241$kcamel19$imindspring$icom$3e$j00000263@gratisnet.com>
Source record: 14627

I have a box of new KU Band LNB's. Input frequency is 11.7 to 12.2 GHz and output is 950-1450. Units are new in the box. The units are conservatively rated at 1.2dB NF. These are high quality units with guaranteed Noise figure performance. Most LNB's out there are rated at .7 dB, but really have 1.0++ NF. These units use a DRO module at 10.75 GHz. The module can be easily removed. I have soldered an SMA cable where the module was located to insert a different LO. With minor tuning I got them to receive great at 10 GHz.

I will sell them for $30 each or 5 for $105 including shipping. These LNB's produce perfect P5 pictures on most birds with a simple 3 foot dish antenna.

PLL RECEIVER BOARDS (50-150mHz), 50MHz Receiver, complete, plus STEREO COMPANDER SYSTEM BOARDS with 2 Channels, 80db sig/noise, & 3:1 Compression

RF SYSTEM COMPONENTS
- for Manufacturers, we offer 30,000 of these prime subsystem boards. Experimenters, and Electronics Educators. Advanced Education, Amateur Radio, and Use in other products (Remember, 30,000 available).

APPLICATIONS:
Lowest Cost RF SPECTRUM ANALYZER http://hoflink.com/~mbarlowe/
Digital Remote Controls
Audio Processing.
Computer controlled Radio
Model Airplane receivers
Frequency-agile systems
"Private" communication channels
Very private distribution systems

MODULES INCLUDE:

PLL TUNER BOARD 50-150mHz
TV (3/4) RECEIVER BOARD Complete TV Receiver
CRYSTAL CONTROLLED FSK RECEIVER BOARD (50.675MHz)
STEREO EXPANDER BOARD 3:1, 80db s/n, Expander with Receiver
POWER SUPPLY 120/60Hz to 5, 12, 22 VDC, Regulated.

DOCUMENTATION:
Schematics and general theory supplied. Easily understood by any ham or tech familiar with general electronics and RF
circuits. We suggest access to a library of RF and Audio IC Data Books for general reference.

GENERAL COMMENTS:
As a set of modules, this is unique in several respects. First, the level of engineering is quite high. These modules WORK !
All highly engineered and proven succcessful, functioning modules manufactured for and specified to work in commercial
cable and wireless applications. Second, there is a large quantity (abut 30,000) available to manufacturers of specialized
products. You can design these in, and we will hold quantities and release against your manufacturing schedule of up to a
year on prepaid deposits. Summary descriptions of each module are below, but your best bet is to purchase a sample
evaluation kit described at the bottom of the page. With this, you can see the quality, evaluate hou they all function together,

and test designs or prepare electronic circuit desig class notes. If you are an educator, these systems are remarkably
inexpensive tutoring tools for lab work. Whatever your choice, Good Luck! We're here to help.

MODULE 1)

PHASE LOCKED LOOP TUNER BOARD, including MITSUMI TUNER MODULE MODULE and DIGITAL PLL CIRCUIT
** EXCELLENT DIGITAL TUNED PLL TUNER SYSTEM** $12.95, or 250 for $9.95/ea
If you need a clean, stable 50-150mHz PLL tuner,
if you want to build an "agile tuning" system, this is a chance to save your dollars:
RF FREQUENCY 50MHz-150MHz (Extended VHF TV Range),
IF FREQUENCY 10.7 MHz
VARACTOR TUNER MODULE Mitsumi 407-A26-5J52
FREQUENCY DIVIDER SP8660
PLL FREQUENCY Synthesizer MC145155
MICROPROCESSOR Z-8
EPROM 2716
EEPROM NMC9306
SUPPLY VOLTAGES = +5VDC, +15VDC,
+22VDC(nil current - varactor tuning)
MECHANICAL DIMENSIONS 7"x 2.2"x 1" high

MODULE 2)

TV RECEIVER (chan 3 or 4) BOARD: $ 7.95, or 250 for $4.95/ea
RF FREQUENCY Ch3 / Ch4
INTEGRATED CIRCUITS UPC1366
TA7303
14046B
OTHER COMPONENTS Many transistors and tuning components
FILTERS 4.5MHz ceramic filter
SUPPLY VOLTAGE 15VDC
MECHANICAL DIMENSIONS 4.6"x 2"x 1" high

MODULE 3)

FSK DATA RECEIVER, CRYSTAL CONTROLLED (50.675MHz) $9.95
RF FREQUENCY US TV Channel 1 (50.675MHz Crystal Controlled)
IF FREQUENCY 10.7MHz
INTEGRATED CIRCUITS TA7303 FM Sound
LM393 Comparator
TA7358 TV Front End
FILTERS Dual 10.7MHz Crystal
SUPPLY VOLTAGES +5, +15VDC
MECHANICAL DIMENSIONS 4.7"x 2.2"x 1" high

MODULE 4)
STEREO FM RECEIVER + AUDIO EXPANDER 3:1 (90db s/n) $16.95, or 500 for $6.95/ea

2 Channels, 80db sig/noise, & 3:1
Compression
INTEGRATED CIRCUITS LM3189 (2)
4558 (4)
NE570N (4)
LF353 (4)
MECHANICAL DIMENSIONS 6.3" x 4.8" x 1.25" high

MODULE 5)

RF SPLITTER / ISOLATOR / AMPLIFIER $5.95
FUNCTIONS Dual Lo Noise RF Preamps (well engineered)
bandpass filters, and
dual LN RF amplifiers.
SUPPLY VOLTAGES +15VDC
MECHANICAL DIMENSIONS 3.5"x2"x1"
ENCLOSURE Completely enclosed "can"
COMMENTS - Users say that this is a solid, well engineered
preamp and splitter for general use.

MODULE 6

FRONT PANEL DISPLAY: Dual 7-Segment LED Readouts $ 2.95
LED DISPLAYS, 74HC164 Mux Drivers,
Encoder Switch for Chan Selecting.

MODULE 7

DC REGULATED POWER SUPPLY: $ 3.95
MECHANICAL DIMENSIONS 5"x 2.7"x 2" high, plus
2"x"3"x3" Transformer
INPUT 120VAC
OUTPUTS +22VDC, +15VDC, +5VDC

Order your sample set today:
All 7 modules, a more than $40 value, with all documentation, for $29.95.
Shipping weight = 8 lbs.

Dear radio amateurs!

I am a student and need a link to a download (or a tape) of a recording
of a conversation with space station mir.

Can anyone help?

Thanks
Alfred.

11-Nov-98 05:15:03: IK has written to the theme
"monitor inmarsat/sarsats ?":

> Hi all,
> May seem like a silly question but is it possible to listen to anything on
> inmarsat or the sarsats with a scanner that goes up to 1.6ghz?

> thanks in advance for any info

> IK

Hei IK,

I think, the downlink-freq. are around 3.6 GHz.

You can use a satellite-dish with a C-band feed.
By using a splitter you can receive the converted
signals around 1.645 GHz.

Ha det !

Rainer

2648. Help for beginner Radio Meteor Observations

Newsgroup: rec.radio.amateur.space
Date: 1998-11-15 00:00:00 UTC
From: John Stowell <Johnstowell@btinternet.com>
Message-ID: <72mh4q$p8n$1@uranium.btinternet.com>
Source record: 14550

I have set up a horizontally polarised dipole antenna aligned roughly east west from Lincoln UK. I have been listening on freqs around 70 mhz but as yet failed to hear anything. This very basic antenna has two elements each 2m in length(in my loft) feeding (by a 4m coaxial cable) an Icom pcr-1000. My question is will this set up work. If so has any body got any more freqs that I may be able to try. thanks in advance.

John Stowell

It's slightly behind Mir by a few minutes so use Mir's keps! Heard her last night, at 0305utc best, the 0440utc pass wasn't as loud or clear even though it was a higher pass. Is she spinning?

73,
Tom

2650. newbie AMSATquestion, modulations

Newsgroup: rec.radio.amateur.space
Date: 1998-11-15 00:00:00 UTC
From: NOSPAMnocoast@aol.com
Message-ID: <364f0d29.620649@netnews.worldnet.att.net>
Source record: 14552

This may be a dumb question but...

For the various uplink and downlink frequencies/modes for the Oscar's
and RS's, which are SSB and which are FM?

I am shopping for a new all-mode rig and am wondering which
modulations are applicable to which birds. I've got the Satellite
Anthology book but don't see anything pertinant.

Also, I'm looking at some fo the ICOM all-mode rigs,
used. Any recomendations for inexpensive, low
hassle equipment? Do the Hamtronic transverters
work as advertised??

Thanks a bunch!

The predicted "best" time is around 3:30 A.M. local time.
Unfortunately, there may be no good time in the U.S. Astronomers
predict in excess of 10,000 events per hour for those lucky souls who
live northeast of Beijing, but only 10 to 20 per hour in the U.S. They
caution that they may be too pessimistic. Let's hope so.

Attention please,

Amsat LU is in the last phase for launch VOXSAT 1 its next satellite
for radio amateurs worldwide service.
VOXSAT 1 will go inside a russian satellite like AO-21, for launch next
year.

The satellite modes will be:

1 Cross Band FM repeater,(like AO-27), UHF up / VHF down.
2 Parrot UHF up / VHF down.
3 Broadcast Voice,FAX,SSTV, (like sputnik 41).
4 CW Telemetry modulate FM.

The VHF output power for the downlink repeater TX is two watts, and four
for the broadcast TX.
Our local organization made a monetary effort for complete it like
when it help with AMSAT NA to finish the first four microsats in 1989.
We have few members for support the launch cost,(satellite transport,
travels, etc), We need your help too.

AMSAT LU made a certified for give to all who make a minimum donation
of u$S 10, for those that make a U$S 100 donation or more his callsign
will be engrave in the first cover of the satellite.

You can watch parts of voxsat at the following address:

http://members.xoom.com/Amsat_LU

If you want to be part of this proyect sent your donation to:

Gustavo Carpignano
M. Rosas 2044
1828 Banfield
Argentina

Checks or money orders should be made out to my name.

Any questions I'll be qrv to answer it.

Thanks for your help.

Gustavo Carpignano, LW2DTZ

Don't forget that by flying behind Mir, it's going slower, and hence in
a
lower orbit. That means that it's actually a little *AHEAD* of the
space
station in time. Ain't orbital mechanics wonderful?

Listen for RS-18 about 3-5 minutes *before* Mir is due to arrive.

Greg.

2655. SEDSAT update?

Newsgroup: rec.radio.amateur.space

Does anyone have an update for SEDSAT? Has the power problem been solved,
and is it in mode A yet?
I've visited their website today, but did not find what I was looking for.

I can't afford $100 but would be happy to make a smaller
donation like US $10, I assume that you would accept smaller
donations? When exactly would the satellite be ready for
launch?

I noticed this last night. The first report I heard from someone said it was
10 minutes behind Mir. Last night it was a few minutes ahead of Mir. Lousy
signal though for a 60+ degree flyover for some reason. Is she spinning?

I've just talked to a local (southern cal) ham who was working random meteor scatter
on 144.200 MHZ this morning (11/16). He's an experienced ms operator and his comment was that this was already the best he'd ever heard it. I personally heard several
stations in the LA area make multiple ms contacts between 11:30 and 12:00 PST.
(I would have had a go myself but I don't have a beam).

Its starting to get interesting !

Clear skies & 73 de

I have had success monitoring TV video carriers (which are 1.25 MHz above
the lower channel boundaries). Channel 3 works best for me but any
low-band TV channel (2-6) should work. I receive in CW or SSB mode -- you
can definitely hear the "pings". Some are short but others can be as long
as a minute. I'm using a vertically polarized discone which helps to
minimize interference from local stations. I think that my particular
discone isn't really supposed to work very well below 100 MHz but it works
well enough for me. It helps if you can feed the receiver audio into a
computer running an audio spectrogram program to provide a visual display
of what you're hearing.

The Leonids radiant is above the horizon from about 0100 to 1300 local
time. Good luck.

Yes it does but not as much as you would think..

If you have, say a 1000 watt signal at 1km the signal loss (drop) would be 10 db in a 1,3,10 ratio. So at 3km it would drop 10 db to 100 watts. Sound like a large drop but think of vert large distances the ratio still holds. At 1000 trillion km to 10,000trillion km the signal would drop only 10dB. Yea there is a point where it gets lost in the galatic noise. Present day technology would allow us to communiate with being at a distance of 1000 light years very easily but I wouldnt want to have to wait 2000 years for a reply!!

2677. any gcc elmers for sattrack?

Newsgroup: rec.radio.amateur.space
Date: 1998-11-18 00:00:00 UTC
From: steve@slac.com
Message-ID: <72vc7bnki1@nnrp1.dejanews.com>
Source record: 14579

SatTrack has me pulling my hair out. I cannot compile the X support in for the life of me. No matter what I try, I cannot come up with the right pathing for the compiler to find the X11 header files. I am editing the X11 and LX11 variables in the Makefile, and all my compiles end up the same.. with a couple of screenfuls of messages about calls to undefined routines that are defined in the X header files Intrinsic.h, StringDefs.h, Xlib.h, and Shell.h.

I must have tried a thousand combinations of paths, as well as editing the failing C file by putting an absolute path in for the header files, but it just refuses to see them. I even put them in the same directory as the .h files that came with the software and it *still* couldn't find them!!

I am able to compile text mode, but I really want to get the X functionality working, too. The part that kills me is that I eventually figured it out 2 years ago with a 2.0.30 kernel, but it's just killing me this time.

If anyone is willing to help see me through this, I'd be most appreciative.

Thanks and 73,

Steve

IIRC the inverse square law applies.
2x the distance, 1/4 the power
4x the distance, 1/16th the power
8x the distance, 1/64th the power
and so on..
The signals soon get very weak but never disappear - just need very good
receiving capabilities :) so not impossible, just more difficult,
especially when they drop into the general background noise.

Sir, I for one have had problems for 24 yrs a ham T-Plus being CW proficient. I guess in your eyes I either make the grade of 13 WPM or back off. Thoery never was a problem, it's that damn code. Thoery of components and there use, building equipment, experimenting, etc. is what build amateur radio, not the code. The code only holds people from progressing in the hobby. Check around the HF bands, there numerous bootlegers there from 11 mtrs. But am honest ham like myself refuses to flick the switch on his 430S and go to it.

By the way, I would have been nice if you posted your name/call or REAL e-mail address.

2685. QSLs On The Web

Newsgroup: rec.radio.amateur.space

Source record: 14587
Cross-posted to: rec.radio.swap,rec.radio.amateur.antenna,rec.radio.amateur.dx,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.boatanchors,rec.radio.amateur.space,rec.radio.amateur.policy,rec.radio.amateur.equipment

This is not an advertisement!

We have been running a contest at http://www.solder-it.com called QSLs on the web where digitized versions of QSL cards are posted each month for voting. The card getting the most votes every other month receives a free Deluxe Micro-Jet Torch.

You don't have to visit the site to take part and if you really dont want to see the other stuff at solder-it.com but want to view the cards, just go directly to http://www.solder-it.com/qsl.htm

Just send your QSL card (or any ham radio related picture) along with your permission to post it written on the back and your e-mail address to:

QSLs On The Web
Box 20100
Cleveland, OH 44120-0100

You can either view your QSL and vote, or when notified that it is posted, vote at: votes@solder-it.com. Of course you should get your friends to vote also. Only one vote per e-mail address permitted. We do not use your e-mail address for ANYTHING other than to notify you of posting and hopefully winning.

Thanks, good luck.

I found this great web page for tracking Mir. It has a nice interface and when you click on your area it will give you data on time and location of its next pass. Easy and great for planning. Just need a JAVA capable browser.

http://liftoff.msfc.nasa.gov/RealTime/JTrack/Spacecraft.html

I'm new to this stuff and have a question about listening modes.
With a simple receiver and discone antenna should I be on FMW/N, U/LSB, or CW?

Thanks.

Does anyone have any WEFAX satellites they listen to? I am finding it hard to find current data on the operating freqs and status of some WEFAX birds. Any help is appreciated..

For mir be on FM, they are in PACKET mode all the time now. You'll hear
Sputnik (it's about 10 minutes AHEAD of Mir) but with Mir's packet station
you'll hear a "brapping" noise as data is sent to and from the station. The
Russian crew onboard doesn't speak English too well I'm told.

Hello to all !

I want to mount a satelite antenna for the 144 Mhz band, with circular polarity, BUT the boom canott be longer than 3.5 meters

Do you know any model with that size ? Or does someone have any design of such antenna, so i can build it ?

Thanks

Probably wasn't mir more like pager ineterference :-)

you will probably only pick up mir on either 143.6250 nfm in russian
or 145.9850 nfm in packet or the sputnik satellite on 145.8120 nfm

Anyone know the status of the SEDSAT-1 bird, and if it is operational on Mode A???

My understanding from traffic on other mailing list(s) is that they are getting telemetry showing abnormalities in the charging and/or battery system(s), which is causing power cycling problems. Unfortunately, so far, the period and phase of the power cycling has had the satellite operational outside of the coverage area of the primary control station. As of the last report i read, so far they have not been able to send commands to adopt more conservative power regime and find out what needs to be changed or corrected. So it sounds as if Mode A may not be on for awhile.

I am returning to ham radio after many years away....I am interested in the "New World" of satellite operation and my question is, How high in the sky are the "birds"? I have a small back yard with many trees and am wonering if operation thru the satellite will be possible. My location is near Syracuse N.Y. (Fayetteville). Any help would be great as I am trying to make up my mind on a new rig, perhaps the FT847 or something else if I cant see the satellites.
Thank's and 73

They change all the time. You should get a satellite tracking program. It will tell you where in the sky a particular satellite will be at a given time.

One place to download a tracking program is ftp.drig.com (site of the Dallas Remote Imaging Group). Go to the /pub directory and get the "trak..." or "winorb.." program -- or get both and compare them.

You will also need the latest orbital elements (Keplerian elements, or "keps"), which tell the tracking program how to compute a satellite's position. You should also find recent keps at the DRIG site.

> David Hawkins, WB2KTM

The effect of the trees will depend on frequency. You can do some satellite work on the 15, 10, and 2-meter bands. The effect of the trees will be minimal on those bands. Depending somewhat on the trees (and the season, in Syracuse), you may see a substantial effect on the 70-cm band. And if you want to move up to the higher sat freqs later, you'll need to buy a chain saw or a good-sized tower.

Look for the Satellite Experimenter's Handbook in a store or at a hamfest. You'll find it very helpful and fun to read.

hope it's ok to post here...

also includes CW filter!....this FT-736R is a great radio in Mint cond.

has 1.2Ghz module...great for working the birds

asking $1499 but open to offers and trades

hamkc7zwg@aol.com

view this radio at Yaesu..... http://www.texastowers.com/ft736r.htm

Good question, amateur radio beacon? Don't think so, although the ham gear
is supposed to be one of the first packages brought to ISS.

Correct, there is no amateur radio hardware on ISS yet. 2m and 70cm hardware with 1200 baud AFSK and FM voice capability and external antennas are planned to launch on the shuttle early next year.

Use of the hardware won't start until after the service module arrives and a spacewalk occurs to place the antennas on the outside of the service module. Keep an eye on the schedules but this will probably happen in the last half of next year...

You can find more information about ISS assembly at http://station.nasa.gov/station/assembly/

You can find the web pages for the Amateur Radio on the International Space Station (ARISS) project at http://garc.gsfc.nasa.gov/~ariss/ariss.html

I have an Icom IC-821-H driving a Mirage B 5016 G and would like to try the 9600 BPS digital birds. I have a few questions though:

1. Which TNC do I buy? MFJ 1070QC, KPC-9600 or What? No HF capabilities are desired in this unit.

2. Which of the 9600 digital birds are active and are any better than others for a newcomer?

3. What terminal software do I need to use with the TNC?

: Probably wasn't mir more like pager ineterference :-)

: you will probably only pick up mir on either 143.6250 nfm in russian
: or 145.9850 nfm in packet or the sputnik satellite on 145.8120 nfm

Oof! I mistyped.. 143.625 was the freq I was listening on. Last night after hearing the Sputnik I waited for the Mir and the sound returned. I compared it to the previous one on my computer and they look practically identical. For a newbie like me this is neat! I've learned more in one week of actual listening than in 2 months of studying.

Then that was probably it, nice one fun isn't it !
Hang around a year or two and the ISS will become a bit more radio
"active" then there will be some good stuff to monitor then !!

good luck

Source record: 14668

andrew:
the sat is in space. and the regular propagation do not work. is more like line of site, the problem is thet the sat is over the ionosphere and do not reflect the energy back to erth.
in orther to be able to resive the beacon or any other signal from the sat or any sat on hf the sat must be with in view od your antena.. in the case of the low orbit sat this hapen often , some times, few times per day. the tric is to know when...for that you must have a tracking program and the kerplarian elements so the program can calculate the sat postion.
good luck.

Any radio beacon.

Well, something tells me that this ISS won't have a simple 143.xxx NBFM
downlink that we can all easily hear on our VHF receivers.
It will probably be full of digital S-band and X-band stuff operating
via TDRS satellites, etc.... not possible to monitor it directly for
radio amateurs.

Or am I wrong?

RS-18, like it's predecessor RS-17, transmits a tone that can be decoded to tell what the internal temperature of the satellite is. The frequency of the transmitted tone is directly related to the internal temperature. What ones needs, is a way of measuring the frequency of that signal. Does anyone know of computer program that can sample an incoming signal and measure it's frequency? Maybe even a program that can analyze a wav file and display it as an oscilloscope/frequency counter. Any info be appreciated. Keith

Keith:
Go to http://www.syntrillium.com

and download "Cooledit". You can play the .wav file via Cooledit and
measure the beacon frequency that way.

RS-18 is a mini Sputnik satellite hand released from Mir on Nov. 11th. It's lifetime will be only around 30 days. It's transmitting beeps and recorded voice messages in several languages. Neat stuff!

145.812 is the center freqency. Use Mir's keps, it's ahead of Mir by 5-10 minutes or so...

73!

It appears you are wrong, Rob. 8)

I asked around and the Russians have asked for the same VHF support that they got on Mir. Will it be as active as it was on Mir, i.e. turned on continuously? Good question! It will be interesting to see what happens. Maybe the Russians will get used to having continuous, high quality, audio through TDRSS...

> minutes or so...
>

The orbits continue to diverge - it's about 20 minutes ahead of Mir, and
in
a different plane. It's best to grab the latest keps (look at the Amsat
site - http://www.amsat.org, and follow the link to the 2 line
elements).

Also, the center frequency appears to be a little higher than
advertised.
I'd guess it's closer to 145.815 (so take that +/- 3 khz for doppler).

Good luck,

Greg.

What you need is a Fourier Transform, usually implemented as
a Fast Fourier Transform. You could even write your own if
you were sufficiently determined. It's pretty simple,
actually, though it can take time to get the butterfly loop
right...

I even saw FFT routines in Basic once. Weird!

2733. linux sat. tracking software SatTrack 3.1.5

Newsgroup: rec.radio.amateur.space
Date: 1998-11-25 00:00:00 UTC
From: Tony Schliesser <aschlies@citynet.net>
Message-ID: <73hmlg$167$1@news.citynet.net>
Source record: 14685

I don't know if this is the right place to ask. I downloaded the SatTrack 3.1.5 from amsat's website. I tried to compile this for linux (redhat 4.2, 5.0, etc) but I get a really odd error from the Makefile:

Makefile:387: *** commands commence before first target. Stop.

```
386 sattrack_OBJ = $(OBJ)/satargs.o $(OBJ)/satcalc.o $(OBJ)/satchar.o
\
387 $(OBJ)/satcity.o $(OBJ)/satctrl.o $(OBJ)/satdisp.o
$(OBJ)/satelem.o \
388 $(OBJ)/satgraph.o $(OBJ)/satheli.o $(OBJ)/satlice.o
$(OBJ)/satmath.o \
389 $(OBJ)/satnute.o $(OBJ)/satprec.o $(OBJ)/satprop.o
$(OBJ)/satread.o \
390 $(OBJ)/satrefr.o $(OBJ)/sattele.o $(OBJ)/sattest.o
$(OBJ)/sattime.o \
391 $(OBJ)/sattrack.o $(OBJ)/satvect.o
```

I did not see anything specifically wrong with the make file and am hoping that someone has made this thing work. :) maybe a freash set of eyes will expose what I am overlooking.

That's nice, maybe we I scan that segment during passes to see if
something appears. (e.g. when they turn it on from Moscow)

Either your makefile is hosed or it is just incompatible with the version of
make
you have. I would assume that linux comes with gmake which is really good,
but you might check to be sure. If not you can download gmake from numerous
locations. Try starting at www.gnu.org

I don't know if this is the right place to ask. I downloaded the SatTrack 3.1.5 from amsat's website. I tried to compile this for linux (redhat 4.2, 5.0, etc) but I get a really odd error from the Makefile...

It compiled just fine for Debian LINUX 1.x, but i did need to hack the flags a bit. The 'diff' file is included below, along with the 'head' of my copy of the 'Makefile' (and your line number in error agrees with my copy). The 'g' command doesn't work in my copy, but i hadn't gotten around to figuring out why, since that feature in my SGI copy wasn't that useful to me. There are no other changes (and i had many in the SGI version).

Ham Radio.FAQ is a frequently-asked questions file intended to
summarize some of the common questions and help beginning ham
radio operators get started.

If you aren't yet a licensed ham radio operator but are thinking
of getting your "ticket", you are encouraged to explore via this
FAQ and the WWW sites it LINKS to and get a sense of how
t o t a l l y neat amateur radio is. After all,
amateur radio IS the first wireless Internet!

You only stand to GAIN - in technical knowledge, operating
skills, new friendships all over the world, and a sense of pride
and accomplishment in earning your license, assembling, and
operating YOUR very own station.

Please provide the URL the Ham Radio.FAQ to any new or soon-to-be
Hams that you know or create a link from your site to us to help
pass the word.

http://www.mv.com/ipusers/wd1v/hamradio.faq.html

Your suggestions, corrections, ideas, and assistance are
appreciated!

2741. Orbital element conversion keplerian -> cartesian

Newsgroup: rec.radio.amateur.space
Date: 1998-11-26 00:00:00 UTC
From: Thomas Gibson <tgibson@array.ca>
Message-ID: <365D7278.2D9100DE@array.ca>
Source record: 14693
Cross-posted to: rec.radio.amateur.space,sci.space

I have a routine that converts from keplerian to cartesian
elements. It was my impression that a standard Brouwer Mean Element
message defined both at an orbital epoch. I used the routine mentioned
to convert the keplerian portion to cartesians and tried to see if they
corresponded to the cartesians provided. They were not close enough to
be satisfactory which leads me to believe either my understanding or the
routine was inaccurate. Is my understanding correct ? Does anyone know
if a generic keplerian->cartesian routine can be easily found in any
freely available code against which I could test ?

Example elements used:

LNDSAT-5 8402101 E 940630. 000000.000

From: KC7ZRU <KC7ZRUnospam@cyberhighway.net>
Message-ID: <365E7C37.C464A3BA@cyberhighway.net>
Source record: 14497

Recorded messages from RS-18 as it passed almost dirctly over Laramie, Wyoming last night (26 Nov - 0736utc). Signal strengh was half scale, clear as a bell on a Kenwood TM-V7A tuned to 145.815Mhz using a matched pair of 4 element beams on a 20 foot mast. Recordings actually sound a bit better than those posted at the Amsat France (AMSAT-F) site (http://www.ccr.jussieu.fr/physio/Satedu/sputnik41.html). Probobly due more to the sample rate then actual recieved quality. 1.2Mb WAV file at my web site listed below.

Heard it again tonite as predicted using STSPlus and the Keps at http://www.celestrak.com - all three passes tonite were more on the horizon, but still sounding good.

Cool Edit reported last night's tone at 1259.6Hz. Pretty tough to decypher more than a guess at the tempurature from the chart at the Amsat-F site. Anyone have a more precise method?

Howdy From Montana KA7YAO - on the 20:50 - 21:05 pass today had 57 on the RS-13 beacon (29.504) and 5/7 on down link (29.470) with only 10 watts on the uplink (21.270). Nothing heard on the 2 meter down link here in Montana. Hope to make a contact or two, but lots of 15 meter traffic today and could hear them all on the down link even though they did not know the Sat was overhead.

Bill KA7YAO

2746. RS-15 Report

Newsgroup: rec.radio.amateur.space
Date: 1998-11-27 00:00:00 UTC

Tony,

I have had no problems compiling SatTrack on both Linux and Solaris.

If you want to send you Makefile to me, I will have a look.

2749. VOXSAT donation

Newsgroup: rec.radio.amateur.space
Date: 1998-11-28 00:00:00 UTC
From: gustavoc@BBS.PINOS.COM
Message-ID: <199811272351.PAA00291@mailbox2.ucsd.edu>
Source record: 14501

Attention please,

Amsat LU is in the last phase for launch VOXSAT 1 its next satellite
for radio amateurs worldwide service.
VOXSAT 1 will go inside a russian satellite like AO-21, for launch next
year.

The satellite modes will be:

1 Cross Band FM repeater,(like AO-27), UHF up / VHF down.
2 Parrot UHF up / VHF down.
3 Broadcast Voice,FAX,SSTV, (like sputnik 41).
4 CW Telemetry modulate FM.

The VHF output power for the downlink repeater TX is two watts, and four
for the broadcast TX.
Our local organization made a monetary effort for complete it like
when it help with AMSAT NA to finish the first four microsats in 1989.
We have few members for support the launch cost,(satellite transport,
travels, etc), We need your help too.

AMSAT LU made a certified for give to all who make a minimum donation
of u$S 10, for those that make a U$S 100 donation or more his callsign
will be engrave in the first cover of the satellite.

You can watch parts of voxsat at the following address:

http://members.xoom.com/Amsat_LU

If you want to be part of this proyect sent your donation to:

Gustavo Carpignano
M. Rosas 2044
1828 Banfield
Argentina

Checks or money orders should be made out to my name.

Any questions I'll be qrv to answer it.

Thanks for your help.

Gustavo Carpignano, LW2DTZ

Not as much as the common sense and etiquette of Usenet posters has
degraded over the last couple of years.

A few years ago, one would post a question, then read the answers and/or
participate in a discussion. These days, one just posts a question and
goes away, to come back a week later and ask it again.

Source record: 14504

It was good to hear some strong, clear sigs on AO-10 this morning, even taking the deep QSB into account!

Managed to work 5 N. American and 4 German stations.
Now hoping to be able to work S. America for the first time in the not too distant future.

Last night, when AO-10 was over China, I got fair downlink sigs back but I couldn't wake anyone up - always another day though!

2754. Software helps interpret Sputnik 41/RS-18 telemetry

Newsgroup: rec.radio.amateur.space
Date: 1998-11-28 00:00:00 UTC
From: h1riley@umassd.edu
Message-ID: <3660446b.0@gatekeeper.umassd.edu>
Source record: 14506

I've uploaded to the HABLIC website a small windows program
that I've written to interpret audio frequencies measured
from the transmissions of the little Sputnik.

It interpolates between the frequencies that have been published
to give results rounded to the nearest tenth degree in both
Celsius and Fahrenheit.

The program is only 8k unzipped and runs under Windows 3.x and
up. This was developed independent of the Sputnik 41 project
management; it's been carefully checked for accuracy, but bugs
do happen.

If you try it out I'd like to hear from you. Look for it
at DOWNLOAD SPECIAL near the end of the HABLIC front page.

I am a beginner.
I read various articles in Science Probe in the past.
I am interested in using my SW receiver than goes to 30 MHz SSB and AM and my computer , to monitor radio signals from solar and other sources.
I have the plans for an aerial , have the receiver and I understand that I could take the head phone signal and via the PC sound card , feed it into the PC.
What I need to know is the likely frequencies to monitor and if I need a pre amp between the aerial and the receiver , I already have an inbuilt aerial matching unit.Then I need software to display the amplitude of the signals.I understand Turbo Pascal and would appreciate any advise concerning processing the signal into and out of the sound card.I also have an anallogue to digital converter and software.I can either feed the aC signal into that , with a ground refernce point so that say 2 volts above and below earth could be displayed.The alternative would be to rectify the signal to DC to be able to monitor the full signal strength but understand over a volt is lost through the diode in the rectifying process.Then there is the question of smoothing out the signal fluctuations.
Has anybody else tried a similar project with simple equipment that could advise ?
Thanks for your time.

2762. SatTrack for Linux

Newsgroup: rec.radio.amateur.space

From: Ed Bacon <ewb@voyager.net>
Message-ID: <73s9uu$k8q@news.voyager.net>
Source record: 14514

Hello,

I've been trying for two days to compile SatTrack 3.1.5 for Linux. The make always crashes when it is trying to link the X11 section.

Have any of you gotten SatTrack to compile? If so, could you send me a copy of your /usr/src/SatTrack/src/Makefile for reference?

BTW, I am running Slackware 3.3, kernel 2.0.30, X11R6

Thanks,

I have to say that the prospect of mailing a donation
payable to a private individual in a South American
country entails too much risk of fraud and abuse.

Surely AMSAT LU can afford an organizational
bank account somewhere.

Any good SW receiver should have plenty of gain. A preamp shouldn't
be necessary. The software you need is called Gram42. It is available
at the following site:

http://www.monumental.com/rshorne/gram.html

The most likely signal to target is Jupiter's decametric radiation.
It should be audible in the 18-21 MHz range. It sounds a bit like
surf crashing on a beach. I doubt you'll hear solar noise on HF.
You'll need a good UHF setup with high gain antennas and a
preamp to hear that. It is simply a frying or hissing type of noise
as the sun moves through the beam of your antennas. You might
hear the effects of solar flares and the solar wind interacting with
the Earth's magnetosphere if you listen at VLF (3 to 30 kHz).

Noise bursts from solar flares are easy to receive in the 25-300 MHz range
when they occur. They will generally be stronger than the Jovian
emissions. Solar thermal emission is harder to detect and typically
requires an antenna with a narrow beam and a low noise preamplifier.

>What kind of cable do they fit? What sex are they?

The center pin is soldered (or crimped, not sure) and the shield is
crimped, a piece of heat shink goes over the crimp. They are made of
brass. I have 56 connectors available, possibly more in storage. While
going through the box, I found a female SMA chassis mount connector with a
long center pin on the inside of the chassis portion.

I think that connectors fit RG-214. That is, coax around RG-58 size. I'm
not too sure about microwave coax numbers because I mainly use hardlines
at work.

Hi Walter! Mir is often quite when there is a Progress
ship docking. This may be the reason, also, there is
some ATV equipment that I believe is being installed and
this may have something to do with it. Don't panic, I'm
sure it will be back online soon!

Hi, Standard LNB's come in two flavors, C band (around 4 GHz) and Ku band (around 12 GHz). The WEFAX transmissions are around 1.6 GHz. But I do remember seeing a very old article (about 10 years ago) where PART of the lnb was used as an amplifier. However, the modern LNB's are so darn small and compact, that doing modifications to them will be almost impossible. Rene VE6WCA (dutch)

Yup!

>would be great if thats correct...any other details about it

Not yet but I heard they were trying to get it going around Dec. 3rd. Maybe
that's why the packet station is down. I'll monitor the 2207utc pass here
today to check what's going on if anything.

Hey folks,

I have started a website and ISP strictly for ham operators. The idea is to get hams to help keep up a website with information updated weekly and monthly. I would like to have all the cool stuff you find on the net in one website. News, mailing lists, callsign database, if its cool I want to put it on there.

I am also offering free e-mail addresses, web services for all ham operators. I am also offering local dial-up service for people in Oklahoma (numbers in Oklahoma City and Stillwater, OK)

Please go check out the site and get your free e-mail account
http://www.hamsnet.net

Thanks for your help

2787. Shuttle/ISS launch tv feed for UK and europe viewers

Newsgroup: rec.radio.amateur.space
Date: 1998-12-02 00:00:00 UTC
From: ian@kmedia.freeserve.co.uk
Message-ID: <3665bed0.54606091@news.freeserve.net>
Source record: 14447

Later tomorrow (thursday 3rd dec) the 2nd element of the International Space Station will be launched from KSC You can see a live downlink video feed in the UK and Europe from the following satellite and frequency

Satellite: Eutelsat 2F2
Position: 10 degrees East
Transponder: 22
Polarisation: Horizontal
Frequency: 11,16333 GHz
Sound subcarrier: 6.6 MHz (English), 7.2 MHz (German)

Transponder up: 08:45 CET
Start of programme: 09:00 CET
Scheduled lift-off: 09:59 CET
End of programme: 10:20 CET

to see countdown of time left to launch go to the following web page

http://www.ksc.nasa.gov/shuttle/countdown/

#PS. There may be some confusion between this launch time (from nasa) and the time that it says above and also on CNN?. be sure to check the countdown page or other NASA source.

From: PATRICK D SCHOUTEN <KA9LNP@prodigy.net>
Message-ID: <01be1dda$b9a18940$046d9cd1@default>
Source record: 14541

For Sale:

Complete Satellite Station Consists of:

Yaesu FT726R with 2 / 432 Module / 6 Meter Module / Satellite Board / Hand Mike / Manuals.

Radio is in good working condition. I would rate the physical appearance at 7 1/2 - 8 on Scale of 10.

A few scratches and some yellowing in the background of the panel meters.

AZ/El Rotors - 2 Gemini antenna rotors with RS232 controller interface for AZ/EL tracking. Rotors are in very good condition.

Antenna System (1) Hygain 216SAT 2 mtr 16 Element W Polarity Switching
(1) Hygain 7030SAT 435 Mhz 30 Element w/ Polarity Switching
(1) 60" X 1 1/2 Hygain Fiberglass Cross Boom

Antennas are in very good conition - they were up about 8 months.

Price: $850.00 PLUS SHIPPING from 84084

I will sell this system less the 6 Meter Module for $650.00 Plus Shipping

If interested please email me at KA9LNP@Prodigy.net

73's and Thanks... Pat KA9LNP DN30 - Utah

2794. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.space
Date: 1998-12-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <742nrh$flk@news.Hawaii.Edu>
Source record: 14542
Cross-posted to: rec.radio.amateur.space,rec.radio.broadcasting,rec.radio.cb

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, KH6OO
(rec.radio.amateur working-group)

2798. Mir switching packet off over uk onwards ?

Newsgroup: rec.radio.amateur.space
Date: 1998-12-02 00:00:00 UTC
From: ian@kmedia.freeserve.co.uk
Message-ID: <3665822a.39078025@news.freeserve.net>
Source record: 14546

I have noticed that on the last 2 passes this afternoon and this evening the packet on Mir (145.9850) has been switched off.

The strange thing is that i heard a perfectly clear packet signal just as it was coming up to the UK but as sson as it hit the UK bang, it went dead and nothing was heard after. I have heard that Russia has taken on a policy of restricting transmissions to ground because of monitoring by the media and them giving bad press but if that is the case hear then this is ridiculous!

Has anybody else noticed this happening ?.

Also i have not heard any SSTV from them yet, i am still not sure of what frequency it is going to be on or when thy intend on starting transmission so i am searching both 70cm's and 2 mtrs just incase on every pass. The Mirex web sites have no up to date news about this for a month or so now so that does not help either.

Any news anybody?

cheers
Ian Koenig

Well, half an hour ago (19:00 - 19:06 UTC on 3/XII) the signals were loud
and clear in the western outskirts of London, UK - RS was 52 on my rusty
but trusty TH-75 with a quarter-wave antenna.

Hi Ian,
The TNC seems to be beaconing an APRS bulletin at reglular intervals but
nothing else at the present time. I suspect they are working on SSTV and that
might be the reason.

>Also i have not heard any SSTV from them yet, i am still not sure of

Yes, MIREX can be slow at giving news, we'll just have to keep checking and
keep our ears peeled for any news.

Still going strong here in SW England this evening - 2 passes at good
signal strength.

Kenwood TW4000 mobile with colinear.

Good luck....

Don't worry... if you did not understand from the German commentary: it
did not go, the launch is postponed until tomorrow.

Is there a signal loss in Space over great distances?

2810. Re: signal loss in Space over great distances?

Newsgroup: rec.radio.amateur.space
Date: 1998-12-04 00:00:00 UTC
From: Erik van Bronkhorst <zipper@ridgenet.net>
Message-ID: <36685D36.CDB8C919@ridgenet.net>
Source record: 14462

Since energy "spreads out" as it travels through space, the energy that makes it from point a to point b is only part of what was actually transmitted.
Like a cone of light from a flashlight, the cone is wider the farther you get
from the source. The relationship is known as the inverse square law.
The amount of energy received is proportional to the amount transmitted divided by the distance squared.
The distance is squared because the energy spreads out both in width and height.
This is a gross simplification, there are many other factors, but the inverse
square law is the most significant in terms of great distances.

Hi,
Just a report. Tonight, 4th. December 1998 Sputnik passed over at 1920 UTC at 50 degrees.
Using a 5 element horizontal beam I was able to hear it from horizon to horizon. At best it was S3 on my TR751. Last week in a similar orbit it was S5.

Still a good easy readable signal, even on less favourable passes.

For years and years I've been trying to listen to the shuttle on 3.860MHz and can get a wonderful signal. EXCEPT when there are some spanish operations on the same frequency. These Spanish JERKS have been interfering with the rebroadcast of the shuttle for a couple years now.

Anyone else have this same problem and does anyone know who these JERKS are?

Thanks,
George

The question is who had the frequency first? Did the spanish station have it then the shuttle broadcast started or visa-versa? I heard those stations tonight, didn't hear WA3NAN at all. Were they on the air? Remember, no one owns a frequency and although I absolutely LOVE hearing the shuttle broadcasts if the spanish stations had the freq first then WA3NAN should have moved up or down a few.....or visa-versa. I'd MUCH rather hear the shuttle but who had the frequency first?

73,
Tom

This has been a problem since day one. Most countries in the world don't allow broadcasting on the Amateur bands. All it does is cause chaos and bad feelings. (Just listen to K1MAN wiping out people everyday, he seems to think he owns the frequencies and the hell with whoever is on them)

Now I admit, the rebroadcasting of the shuttle is interesting, however, if stations
want to broadcast get a broadcast license and get off the amateur bands. If every
ham in the world decided that they wanted to broadcast something what would be left of the amateur bands? It would be nice if a license could be issued to anyone
who wants to broadcast and allow them to transmit just outside of the amateur bands. Then we wouldn't have complaints like we have about K1MAN, WA3NAN and the ARRL's broadcasts.

Just my 2 cents.

hmm, agree to an extent, but perhaps SAREX missions shoyuld be
re-broadcast on ham freqs as it is in the ham arena so to speak.

but i would rather listen to wa3nan than a bunch of spaniards sending
porno is sstv

just my 2 and a half pnce worth :-)

Hi all,
This morning I worked an N1 station in Vermont on AO-27 at 1452utc but I was QRP with 5 watts and a telescoping whip. I was only able to hear the N1 portion of his call but not the rest. The call sounded like N1JEB but I'm not positive. I DID hear him repeat MY call however. If this station is on the net reading this could you please drop me an e-mail? I can see I'll have to get that Arrow handheld beam as the signals are weak most of the time.

Thanks and 73!
Tom

That is almost certainly the excellent Vermont station, N1JEZ <Mike73@aol.com>.
He will probably respond to you by e-mail as well. He can work practically
to the horizon and is an occasional rover, giving out interesting grid squares
as well.

When you can routinely work 15-20 degree passes, send me e-mail and we can
setup a sked. for at least two grids in California. (That applies to others
on the East Coast as well.) 73's and good luck!

I am looking for any info, including websites, that have to do with satellite communications using UHF/VHF. What is needed??? Do I need two or more transmitters or can I use recievers for the downlink freq???
Any help will be greatly appreciated.

Alex

Good Afternoon:

This morning at 1308 zulu, I worked G3ATE, Robert, in Central England.. not sure if I copied the call correctly, as it was at the tail end of his
availability..

This being my first satellite qso, hopefully I have it correct.. if anyone can verify, I would certainly appreciate it.

Also, any help out there for fumbling first timers on the birds ? Would appreciate some sage advice as to where/when/what to look for.

Thanks in advance... rgds 73 de Bruce VE1NB mackermas@ns.sympatico.ca

(drop the s in the mackerma... avoiding junk mail)

The same problem exists with the ARRL & the W1AW broadcasts Tom. I have heard a
QSO in progress and W1AW will broadcast their
bullitens over top the two stations in QSO and I have never heard
W1AW ask if the freq is in use BEFORE they broadcast their bullitens.
They think the freqs they use are theirs and don't care if they cause
interference with other stations.

Walt.

2829. What became of the Apollo 13 LEM?

Newsgroup: rec.radio.amateur.space
Date: 1998-12-06 00:00:00 UTC
From: (unknown)
Message-ID: <366a1d7f.29374300@news.mindspring.com>
Source record: 14481

When Apollo 13 was on the way back to earth, the LEM was let go approximately 6 hours before splashdown. My question is, where did the it go? Was it close enough to earth to burn up or is it forever traveling throughout space? If it's still in space, where would it be by now? I know the other LEMs were crashed back into the moon after seperation.Thanks.

Hi all,

I am currently looking forward to getting the SSTV pictures from MIR
when they eventually start to send them out.

I was wondering if anybody who happens to get some that I cannot ie.
out of range of the UK, and from as many different countries as
possible would like to swap pics with me for ones that you cannot get
ie. over UK and out of your range?.

Please send me an e-mail if you would like to set this up and i will
mail you back as soon as possible

ian@kmedia.freeserve.co.uk

thanks all.
Ian Koenig

Isn't the Earth captured by the Sun's gravity -- are we going to burn up TOO :-)

It takes a lot of energy to change a orbit -UP- or -DOWN-

items in orbit about the SUN do not Fall in to the sun.
Something must first change their orbital speed.

2837. HELP! Tracking the Moon

Hi Guys,

I am trying to write a program that calculates the moon position in RA and Dec to within a degree or less. This is to steer a very large antenna. Currently I am using a program based on the formulas in "Practical Astronomy with your Calculator" , but I am getting results that are off by about 10 degrees. I have not taken into account the parallax, but I don't believe that to be my problem. Please help with any algorithm you might have.

Best Regards,

Pieter Ibelings

:
: The LEM entered and burned up in the Earth's atmosphere.

Did it burn up at the same time as the CM re-entered or did it manage
to make a few orbits ?

The normal Apollo re-entry velocity was about 11 km/s (in a very
shallow angle) and since the escape velocity is about 11.7 km/s, so it
could not orbit the Sun in any case. Since the lunar flight were
conducted near full moon, the Moon must be on the opposite side than
the Sun. If the LEM missed the atmosphere with a narrow marginal, it
would end in an orbit with perigeum of 200-300 km and apogeum of
300000 - 400000 km (in a direction away from the Sun) at around the
altitude of the lunar orbit. But since the Moon had moved, it would
not re-encounter it any more. If the flight had been conducted during
the new moon, the apogeum would have been towards the Sun, but still
the Earth-Sun Lagrange point (where SOHO is now) would be at around
1.2 million kilometers.

Anyway, even if the LEM had been in such a highly elliptical orbit, it
would have burned up in the atmosphere within a few orbits due to
gravitational interactions from the Moon and the Sun into the orbit.

Unless the LEM was remotely controlled to use its main engine to get
away from the CM (and since the CM attitude control trusters had a
minimal impact on the orbit), the LEM and CM would have had very
similar orbits and thus, the LEM would also hit the atmosphere about
the same time.

The LEM burned up in Earth's atmosphere, the plutonian generator landed in
the Pacific and now rests at it's bottom. In a very think casing...

2853. P3-D: Uplink/Downlink Mappings

Newsgroup: rec.radio.amateur.space
Date: 1998-12-08 00:00:00 UTC
From: Al Gerheim <gerheim@brainiac.com>
Message-ID: <366D2C03.DC9CF5D0@brainiac.com>
Source record: 14355

Phaes 3-D has uplinks on 12 and 15 meters. Which downlink will these be mapped
to? I asked AMSAT (twice) and they said, basically, yes, they will be mapped to
downlinks (makes sense!). But which ones?

TIA!

Please reply by email, as I don't monitor NG's very often.

2854. What did I hear?

Newsgroup: rec.radio.amateur.space
Date: 1998-12-08 00:00:00 UTC
From: ke4zv@bellsouth.net
Message-ID: <368567de.1196020185@news.atl.bellsouth.net>
Source record: 14356

While testing my new FT847, I heard something that sounded like a LEO satellite centered around 145.885 MHz from 11:10 EST to 11:19 EST this date. The signal sounded like broadband noise with obvious spin modulation. The raised noise bandwidth was only about 15 kHz wide. I was using a vertical and no external preamp. The signal was about 3 db above the receiver noise floor. What the heck was this?

Try http://users.skynet.be/on1cau/#Top for satellite tracking
programs.
I have played with most of the programs and I liked Winorbit the best.
The latest version is 3.5.
I don't remember where I got the latest version from ,but I think he has a
webpage.

Hi Gary,
I show these possibles. Don't know the craft names though:

Norad # Freq.

18129 145.880

21087 145.892

14129 145.900

Hope this helps.

Phase 3D has a matrix switch which allows arbitrary mappings of uplinks
to downlinks.

The LEM had batteries for power. That's why they had to go to such
lengths to ensure they conserved enough power to get all the way back.

Of course there were no Plutonian power supplies on board! The modern
"ham" could not tell the difference if it landed in the back yard!

Could it be one of the Amsat guys doing range testing of the AO10 to
determine its attitude? They were doing such testing recently with
some softaware that loops data through the analog transponder to
accurately guage the distance.

: The LEM had batteries for power. That's why they had to go to such
: lengths to ensure they conserved enough power to get all the way back.

Of course the LEM itself was battery powered, but the intention on all
Apollo landing missions was to leave behind a scientific package
ALSEP, which contained a seismometer, magnetometer and other
instruments in addition to a radio transmitter to send the information
back to earth. Since the lunar night is two weeks, this had to be
powered by an RTG called SNAP, which was powered by plutonium. The
ALSEP and the plutonium was in the lower part of the LEM and as such
would re-enter when the LEM re-entered.

No, but the fan is pretty loud.

>lucky so and so i want one of those, what do you think of yours so far
>?

I like it. I had the FT736R, and this is a better radio than that. I have
the IC275H and the IC475H, and this isn't a better radio than them,
but they don't do HF too, and this radio is a lot smaller and more
convenient than the pair of them. It will be much easier to take out
portable. My intent in buying it was to have a backup radio that I
could also use portable.

That's unlikely. I was running no preamps, and using only a vertical.
The receiver in this rig isn't *that* hot. I've heard spin modulation of
the noise floor of Oscar 10, but that requires good beams and mast
mount preamps.

AO-27 flew virtually overhead this morning (12/9) at 1445 UTC,
and I couldn't hear it, or reach it on the uplink. I was running about
35 W on a J-pole about 40 feet off of the ground. Was it not working,
do I need a circularly-polarized antenna, or what? I really want to
work stations through it, but I'm getting a little discouraged.

Gary, when you ask a question rather than answer one, i know it's not going to have an easy answer! Here's some observations:

While testing my new FT847, I heard something that sounded like a LEO satellite centered around 145.885 MHz from 11:10 EST to 11:19 EST this date. The signal sounded like broadband noise with obvious spin modulation. The raised noise bandwidth was only about 15 kHz wide. I was using a vertical and no external preamp. The signal was about 3 db above the receiver noise floor. What the heck was this?

Now, if it were 12:10-12:19 EST, there were at least three LEO birds up at that time on 2 meters, but none were on frequency, and two out of three at low elevations. My database (a hand-updated 'modes.dat') has only AO-10 and P3D for that passband, but even if you were close enough to hear them testing P3D, then where would the spin modulation come from??

As you previously noted, AO-10 is awfully far away and MEL of AO-10 occured about 5 hours earlier, and shortest range was at the start of the pass. I have heard its beacon in one occasion with less sophisticated equipment, after having been instructed to try that by a local AO-10 enthusiast. (And was i surprised!) But i doubt if it was on this kind of pass (Tuesday, it was up for about 10 hours). If i recall, i think it sounded like maybe 'colored' broadband noise on FM. But if you noted a doppler shift during the period in question, that would definitely rule out AO-10, which was up at the time and might not be too high in the sky to be receivable with an modest gain omni vertical.

As far as what's not in my 'modes.dat': PANSAT, TMSAT, and TECHSAT all have 70cm downlinks. SEDSAT receives, not transmits, in the relevant passband, and is currently only believed to be transmitting telemetry at approx. 437.91 MHz. RS-18 is nominally at 145.8125 MHz and MIR SSTV was proposed at 437.975 FM (and not yet heard). Besides neither MIR nor RS-18 were up at the time. Since there's much more room in the space sub-band at 70cm than at 2m, the latter is mostly uplinks.

As previously noted, you ask tough questions!

Hello Pete:

I worked through the AO-27 this morning, with no difficulties. Set up here is FT847, running about 30 watts to a J-pole up about 30 feet. The receive antenna is a dual bander vertical up about 25 feet.

So, I would say hang in there.. it will happen. I've never heard myself either on the satellite down link.. I just set transmit on 145.850 FM, and tune +/- 10 until I can hear the down link carrier... then just follow the down link signal with the vfo, and leave the up-link set to 145.850.

Good luck.. rgds / bruce / VE1NB

This looks like you have a list of norad object numbers and their
corresponding downlink frquencies. Interesting. Is it published
somewhere?

What you sometimes can hear on those freqs: someone uplinking to a 9k6
pacsat satellite. When it is a good station, it will have "doppler shift",
but with a reversed direction. There may be fading as well, as his antennes
are probably yagis that are tracking the bird. Spin modulation is tougher,
of course.
Also, it would not be very social to key the transmitter all the time, so
unless he is a big gun and gets all his packets through at first try you
would normally hear the signal key on-and-off all the time.

When I still was active on pacsats I sometimes heard uplinking stations.
Of course this is only likely in a densely populated area, as you normally
hear only a small fraction of the stations in the coverage area of a LEO
satellite, certainly when not aiming beams at eachother.

Hi Ian

Don't waste time scanning the whole band just concentrate on the three specific frequencies. Connect a cassette recorder or a PC with soundcard and something like 'Recall' software to your scanners audio and just leave it running. You are only ever likely to capture a couple of minutes worth of signal on each pass so you need to make sure you are on frequency when they are in range.

Just to confirm it can be done, I heard them a couple of days ago on 279.00MHz AM for about 40 seconds performing an EVA, and early this morning 03.19UTC on 296.8MHZ AM (strong) and 259.7MHz (weak) again perfoming an EVA.

My location is Southampton UK.

Hope this helps

Regards

Martin

2892. Janel Labs Pre-amp

Newsgroup: rec.radio.amateur.space
Date: 1998-12-10 00:00:00 UTC

I was given a Lanel Laboratories 2 meter pre-amp and it has on the front starting from the top QSA 5, on (led) Out (switch) in - on the back is transmitter and antenna pl-259 jacks and I would like to know if anyone knows of this pre-amp and if it has a rf switching circuit in it - It sure does amplify on receive when I put it up at the antenna, but afraid to xmit on it.

I couldn't characterize a doppler shift, the noise was too "white". But the spin modulation was clearly audible, and sounded about the right rate for AO-10. But I find it hard to believe that I was actually receiving AO-10 with the setup I am using. I definitely did not hear the beacon because I tuned down to listen for that, and there wasn't a hint of signal near the beacon frequency (is the beacon even still working?). I didn't catch the start of the signal (I was tuning around), but I did catch the end of it. It faded out quickly in a manner similar to most LEO satellites.

I'm now wondering if what I heard was an *image* of a commercial or military LEO signal. Assuming it is sun synchronous, I'm going to listen for it again to see if it repeats. (I know that I *can* hear VHF LEO sats with this setup. I've managed to ID several, but none having the signal characteristics of this one.)

Well done - haven't managed to catch them myself yet so at least you've given me the incentive to keep trying!

Also waiting eagerly for the Russians to start their slow scan tv transmissions.

To all,

Incase it is of any use to you all I have put a 7 day pass chart for both MIR and the ISS on this site, it is based on passes for South West UK and also contains the latest MIR and ISS contacts I have heard etc . I will also have A Mir SSTV gallery when it starts

no graphics other than the gallery and no fuss/flash stuff to waste your online time ! how refreshing :-)

Has anyone had any success lately working thru the MIR SAFEX UHF Repeator? A friend and I have had great success working the 1200 baud packet station on 145.985 and was curious if the UHF Repeator was operational? You read so much about the success of AO-27 but don't see much on this repeator. Also, if it is operational, any operating suggestions or hints would be welcome.

All help is appreciated.

Hi All

In response to Robert Cooke's request to post the WAV file to the group I can if required, (although it will take me a bit of time to get it into WAV format).

To save bandwidth I can post it to individuals if requested. Let me know if you wish to hear it and I'll convert it to WAV over the weekend.

Regards

Martin

Now this is a tough one Gary: www.nasa.gov

To help you out go directly to the manned space page at:
spaceflight.nasa.gov/index-m.html on that page select "Realtime Data" and
then "Orbital Elements" or if your browser is capable you can view Nasa's
tracking map directly

Hi All

The next best monitoring opportunities for Shuttle EVA comms monitoring in the UK would apear to be tomorrow Sat 12th December.

If I have converted the mission times to UCT via CST correctly (A big if !)

The best times would seem to be:-

21:09 Not good distant pass to the south east
22:40-22:45 Again a bit too far out to the south east
00:11-00:22 Good passes from south west to south east via south
01:45-01:59 Good passes from south west to south east overhead at 01:50
03:20-03:35 Good passes from south west to south east but EVA should be complete

Please advise the group if you believe any of this to be incorrect

Providing the Shuttle position relative to your receive location is OK (i.e. the Shuttle antennas are not screened by the craft its self) you should be able to hear something even with a very modest antenna set up my previous monitoring experiences with the shuttle tends to suggest that it is 'all or nothing'.

fromwhat i have ben told the shuttle do not use the 200hz band while
in orbit, they only use that around launch and land times

you need to be able to aim and track your antenna at AO-27 [it is a
fast moving bird].

Excuse me, but i worked AO-27 for almost a year on a 2 meter quarterwave (both uplink and downlink) and it worked fairly well, outside of urbanized areas. I was, however, taking advantage of its vertical pattern at the third harmonic:

http://www.qsl.net/kd6pag/nec/2mModGndP.html

which has actually several dBd of loss at 70cm for terrestrial use. But was just the right thing for my purposes. That's not what i actually used (i didn't want to model something gutter-mounted on a van with NEC2), but it gives you an idea of the pattern. Not surprisingly, i did not like the overhead passes. (And i still don't with a hand-held antenna, either...)

The only time i used a conventional gain omni was on low elevation passes (less than about 15 degrees) because it's 'pancake' pattern was miserable for satellite work. If you're not hearing sats with your fancy antenna, try something alot simpler.

If you take this approach, use headphones and don't expect to hear your own downlink. Just don't transmit until you can at least copy callsigns. You'll need a 70cm pre-amp (or maybe a sensitive reciever [my approach]). But i did get close to half of WAS that way, including QSOs on several occasions from CA to VT.

But an Arrow (or comparable antenna) works alot better.

New Amateur Radio Search Engine online......

There is now a dedicated Amateur Radio Search Engine for amateur operaters. It is located at http://www.surfsouth.com/~wharrell/fest

This is the Sunbelt Hamfest site and has the link to the new search engine. As the database grows it will help Amateur Operators locate Amateur relate sites easier.

Sell that surplus gear during the holidays and have more for Christmas. Send your listing to wharrell@surfsouth.com and put in Subject: Hamfest Listing

We look forward to your emails and invite you to post your page in the Search Engine.

The hamfest boneyard listing is free.

Thanks to everyone who has responded so far. I finished
building a 2M egg beater antenna, and I'm asking for a Ramsey pre-amp
kit for Christmas. When I got my license nearly a year ago, I built a
5 element 70 cm yagi, just for fun. I could use that, but it would be
cumbersome, since I rely on Winorbit to tell me where the bird is. I
have an HT and a scanner, so I have a few options. I was relying on an
article in CQ VHF (October) where the authro was saying that he
could hear himself on the downlink using an HT, and that's how he
accomodatined the doppler shift, and new he was making contact. I'll
keep trying in the weeks to come.

Pete.

Fantastic! Now, does anybody have a recommendation on a good
SSTV program that can decode the (reported) Robot 36 format?
I have JVFAX 7.0, and that isn't one of the supported formats.

Thanks,

Greg.

I use chromapix, you can get a demo from their web site at
http://www.siliconpixels.com, it times out after 30 minutes though :-(
then you restart

Ian Koenig

by the way they are back on packet today 13/12/98 i think the sstv pic
i got was a one of spontaneous one, hmmmmmmmmm i wonder if i was the
onlyone to get it as it was totally unexpected on that freq ?.

anybody else get it !

byeeeeee.

Ian, or anyone else who can help.

Could you possibly post a quick tutorial for us DUMMIES out there that have never played with SSTV. Perhaps some tips and equipment needed?

Thanks.

Not over the UK anyway. (13.12.98)

Listened out for the SSTV but the first two passes were packet.
Next pass was SSTV but I only managed to get one very grainy pic.
Last pass I could hear the cw ident and little snatches of SSTV

Hoping for better results another day.

RIGHT, for a start you need a computer , a radio capable of receiving the frequencies you will be listening to. Then the software , to get an image all you need to do is play the audi from the radio to the computer's sound card via a 3.5mm headphone type plug, have the audio from the radio preferebly going into the "line" input of the souind card, it's that simple. to get a demo of a very nice sstv programme try http://www.siliconpixels.com thsi demo times out after 1/2 hour then you have to restart but itr does cover the robot36 mode that MIR is sending. for more info just go to alta vista a type "sstv@ and do a search as there are plety of sites with good info on them

Ian Koenig, via somewhere else at the moment

2933. MIR sending slow scan on 145.985 MHz

Newsgroup: rec.radio.amateur.space
Date: 1998-12-13 00:00:00 UTC
From: Tim Hynde <ka8ddz@eaglequest.com>
Message-ID: <3674254A.18A90B67@eaglequest.com>

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.space,rec.radio.scanner

The Cosmonauts aboard MIR have been sending SSTV this weekend, don't know how long it will continue but using a sound card program, an HT, and and a dual band ARX-270B antenna here's what I could see this weekend. They are using the beacon freq 145.985 MHz.

http://www.eaglequest.com/~ka8ddz/mir.html

I missed the best pass, but there is one more this evening. It was pretty cool, the Cosmonauts were making comments in English about the pix, the signals were very strong and full quieting for 75% of the pass which lasted about 10 min here in Michigan.

73, Tim, ka8ddz

Yes it seems a bit sporadic at the moment but they are supposed to be
tx'ing on 437.9750, wether there is a problem with the 70cm's radio i
am not sure , still keep listening :-)

The SSTV transmissions were going strong today 12/13/98 during the
afternoon (East Coast USA) passes. I wasn't able to receive a clear
image using the ROBOT 36 format yet, but SOMETHING was there!

2941. looking for 16 bit MIR SSTV software

Newsgroup: rec.radio.amateur.space
Date: 1998-12-13 00:00:00 UTC
From: Steve Porter <sporter@up-link.net>
Message-ID: <36748A63.3C55@up-link.net>

To partially answer my previous posting... I found that if your software doesn't do ROBOT 36 C format, you can copy the image in black & white using BW 32 (which JVFAX 7.0 does support).

Greg.

2949. newbie questions about meteor observing\scatter

Newsgroup: rec.radio.amateur.space
Date: 1998-12-14 00:00:00 UTC
From: aaronp@removeme-shore.net
Message-ID: <ghbd2.539$J4.121133@news.shore.net>
Source record: 14252

Last night I spent from 10pm-3:45am trying to pick up meteor receptions and scatter during the Geminids to absolutely no avail. I must be doing something wrong and I suspect it is something obvious. Can anyone help with these questions?

1. What receiving mode should I use? I tried to listen to the channel 3 TV video carrier as it is the only channel not carried locally in Boston. On FMwide mode I heard a noise that was intermittant enough to make me think it was meteor activity at first. It increased as the night wore on. But the signals were way too long to be meteor, don't sound like the "pings" I hear sampled on web sites, and every once in a while I get voices. On FMnarrow, CW, USB,LSB, and AM I get nothing but static after very long listening periods. TV video comes in strongest at FMnarrow, is that what I should set my receiver to?
I also tried receiving 50mhz beacons because of the lack of tv signals for me to use. I used CW and USB on those but picked up nothing as well. What do those beacons transmit on?

2. What do the meteors sound like? On some web pages they say to listen for pings and sounds of tuning forks being struck. On others they say listen for actual sounds of what you are listening to, ie voices for tv audio.

3. Does anyone do this from the southern New England area? If so can you recommend some beacons for use?

Saw a bulletin on packet today from ZL2TZE. There are / were problems
with having too many bandpass filters in the 70cm setup. Supposed to be
sorted now (confirmed as 437.975 FM 5W) but I monitored 2m and 70cm just
in case:

Nothing heard on 434.975 (or close to it)
All activity on 145.985 (+- doppler)

Thaanks, but I actually spent time there last night (I visited just about every meteor page on the net!). It doesnt really answer the questions I have. Like 99% of the scatter pages out there it is aimed towards those who already are heavy into dxing. I'm a newbie just interesting in counting meteors and listening for now.

You should be listening in CW or SB modes. Tune around to the three
offsets, 61.240, 61.250, and 61.260. Eventually you'll hear some pings.

Last night between 0400-0530 I heard lots of long bursts on ch 3+.
Was necessary to null out ch 3z from Sacramento, though.

From: aaronp@removeme-shore.net
Message-ID: <FAId2.604$J4.134142@news.shore.net>
Source record: 14263

Well thanks to help from folks on this newsgroup I finally heard my first meteor. Last night I spent from 10pm-4am listening and heard nothing. Tonight, armed with advice from this group, I began listening at 9:30 and had my first "contact" just a few minutes later! And after an hour of quiet pings I heard my first huge, multi-second meteor. I cant wait to start running frequency analysis on these suckers and see what I can find out. Luckily I captured it on computer and will post it on a web page I'm building aimed towards newbies like myself. This is great fun. Thanks for the help!

to do it inexpensively, for weather satellites a crossed dipole is
suitable but will offer little gain and may suffer dead spots. ideally
a quadrifillar helix or similar would be nice, but for general APT
polar satellite work most opt for the crossed dipole. for hrpt or
geostationary satellite work a yagi beam antenna or dish is needed .

I haven't come across a good program for Windows 3.x, but several DOS programs will run fine under 3.x in Standard Mode (i.e., turn off Enhanced Mode in Windows). You'll need a Hamcomm-type interface -- they don't use a sound card.

I recommend EZSSTV, which has been available at www.ultranet.com/~sstv/

Does anybody know if anyone connected with the MIR SSTV project is posting any up to date info on what is happening up there as I can only find a total LACKA of info about what's happening. Today I have heard no packet or SSTV just Russian voice on 143.6250, seems like this project is going to fall flat soon :-(

and yes I have checked the MIREX web site which has not been updated for AGES !.

To all radio amateurs

SB SPACE ARL ARLS016
ARLS016 Sputnik 41/RS-18 QRT

The second mini-Sputnik satellite, Sputnik 41, went silent on or about December 10, according to reports. The little satellite, also known as RS-18, was launched by hand from the Russian Mir space station during a November 10 space walk by cosmonauts Gennady Padalka and Sergei Avdeyev.

Sputnik 41 was powered by nonrechargeable batteries and designed to operate for up to a month. Its predecessor, Sputnik 40--launched in November 1997 to commemorate the launch of the original Sputnik satellite in 1957--continued to transmit for 55 days. The later Sputnik 41/RS-18 transmitted recorded voice beacons in English, Russian, and French as well as a beacon tone that indicated the satellite's interior temperature. It transmitted on or about 145.815 MHz

Sputnik 41 was financed by the Aeroclub de France to mark its centennial as part of a program of satellites made in a collaboration of Russian and French students. AMSAT-France cooperated with the education department of the Russian Aeronautic Federation in this most recent Sputnik reprise.

Reception reports go to AMSAT-France, Sputnik 41/RS-18 QSL Manager, 14 bis rue des Gourlis, 92 500 Rueil-Malmaison, France. Reports should include a 5x7, self-addressed envelope and two IRCs.

An updated list of reception reports received by the French QSL manager is available at http://ourworld.compuserve.com/homepages/ascerland/sp41QSL.htm. The page lists reception reports from some 40 countries around the world.

For more information, visit the 1998 International Year of Air and Space page, http://www.ccr.jussieu.fr/physio/Satedu/sputnik41.html.

Easiest way to listen is to tune to 50.125 USB and just listen. When a
meteor goes by you can hear cq's come up out of the noise for a few seconds.
If your quick enuf you can owrk a few. I worked 5 stations in one hour with
ramdom MS CQ's

Hello all,

Is DO-17 also known as DOVE Active? I have not heard anything on 145.825 in a long time. I've listened for it on about 8 different orbits in the past week, but have heard nothing. I used to be able to hear it loud and clear on an HT.

Thanks a lot.

I found this great page that lists software for SSTV:

http://www.ultranet.com/~sstv/download.html

It shows what the requirements are for each package.

That's very interesting if you run Microsoft software. But i've got a couple of older Macs and a LINUX box, so *nothing* there is relevant to me. Anyone have any idea for the non-Microsoft folks out there?

Hi there everyone,
I would like to get started in this branch of ham radio...

I currently use HF band and packet radio as my main bands but I always
wanted to get around EME work but I was told that unless you have a big bank
account and back yard it is almost impossible to achieve any results!

I have an IC 475H as a rig and undecided on which antenna to use.

Any advice?

regards
Nico VK6BOS

2979. strange happenings on MIR today?

Newsgroup: rec.radio.amateur.space
Date: 1998-12-16 00:00:00 UTC
From: ian@kmedia.freeserve.co.uk
Message-ID: <36779c47.5764992@news.freeserve.net>
Source record: 14281

While on it's 11:30 gmt pass over UK today I heard nothing from MIR on any frequency until the last second of the pass. Then I picked up the usually Russian voice on 143.6250 but there was clearly packet radio operating in the background as they were talking ?. I checked every frequency I have for MIR including 145.9850 pms, and all the SAFESX frequency's ....no packet !

What is this secret packet they have ?

and yes yet again no SSTV over UK !

You can't, because the Moon doesn't really orbit the Earth -
the two orbit the Sun together, around a common center of gravity.
The orbital models used for satellite tracking assume that the
satellite has negligible mass compared to the Earth, an
assumption the Moon violates.

There are programs out there that will synthesize pseudo-Keps
that will work for a while, but they go stale quickly. Anybody?

2982. Re: Ham Radio Utilities for the Palm Computer [AO-27]

Newsgroup: rec.radio.amateur.space
Date: 1998-12-16 00:00:00 UTC
From: John Mock <kd6pag@qsl-nojunk.net>
Message-ID: <871zm0c9wk.fsf_-_@mongrel.kd6pag.ampr.org>
Source record: 14284
Cross-posted to: comp.sys.palmtop.pilot,rec.radio.amateur.space,rec.radio.amateur.digital.misc

Excellent! How 'bout adding a feature to predict AO-27 passes
from a given lat/long? Well, ok, that's maybe more than just a
"feature"... ;^)

Well, since most folks wanting it for a Pilot will be operating hand-held,
AOS/MEL/LOS will probably be sufficient (unless you have a serial interface
for your rig and want to automaticly compensate for doppler). So what i do
is write out the 'short form' output of SatTrack (available at AMSAT.ORG
for many non-Microsoft/non-Apple platforms) and then run a modest Perl5
program that writes a file which 'install-datebook' downloads into my Pilot.
If you are close enough to the SF Bay Area for this to be helpful, you may
find a fairly current copy of that file at:

http://qsl.net/kd6pag/AO-27.pilot

That way you can also see some sample output in case you want to 'roll your
own'. That version also reminds about 10 minutes in advance of the pass,
which is invaluable for being at the right place and the right time for
operating hand-held. And, no, it doesn't remind you about evening passes...
grin
73's, good luck, and catch you on the 'bird!

-- KD6PAG ("Networking Old-Timer, RF newbie")

P.S. Skeds welcome to all 50 states and most provinces, for CM87/CM88 and
other 'nearby' grids given sufficient notice. If interested, please compare
http://qsl.net/kd6pag/AO-27.passes with predictions for your own area and
suggest one. (I often can work lower than 10 degrees given enough notice,
but not on a routine basis, so those passes aren't included there.) Weekdays
preferred.

It should be possible. I read of some California hams trying it
when the Shuttle landed at Edwards. I don't think that they
had any success, but that could have been because the
geometry was wrong, or any of a number of other things
could have been wrong.

>
>Any advice?

If you set everything up just right, you should be able to do EME with
a quartet of 70 cm boomers in a H stacked array. That's not huge.
You won't work the smaller stations, but the big guns should hear you,
and you should hear them. Note, the lowest possible loss feedline, and
an antenna mounted preamp will likely be needed. Best times will be near
lunar perigee, and when the moon is near your local horizon, IE take
advantage of ground reflection gain. (That means you won't need an
elevation rotator either.) Don't expect to make random contacts.
You'll need to pre-arrange schedules with big gun stations.

If you buy a preamp, the SSB Electronics units are nice. But if you
want to build, you can get a very good design from the Proceedings
of the Central States VHF Society volumes (available from ARRL).

If you want to be able to work random stations rather than just keep
schedules with the big guns, you'll need 8 or 16 boomers, an amp,
and ability to do az-el tracking. That'll make you a medium size gun.

For economy, I'd suggest you build rather than buy your antennas.
There are some good designs available. But if you prefer to buy,
there are some suitable boomer antennas available from the usual
suspects.

Of course you'll want to install a narrow filter in your 475H if you haven't
already, and outboard DSP can be useful for ear copy too. I recomend
using AF4Y's spectrogram program as a visual way to locate and copy
signals. You can often copy signals that way when you can't by ear. (Note,
consider this a software substitute for hardware DSP. Running both in
tandem usually doesn't work so hot. The quantizing noise from the
multiple A/D D/A conversions adds.)

Now all this assumes you'll be doing OOK Morse. If you use a suitable
error correcting digital protocol, you can ease up a bit on the power
and antenna array size. You can net about 9 dB with signal design and
coding over OOK Morse for this purpose. But then the problem is to
find someone else to contact because most EME operators are still
of the by ear and by hand school (for the challenge I'm told).

If you build your own antennas and preamp, and rotate the antennas by hand, you can probably make a contact with a big gun station for a total investment of $300 to $400 over what you have now. To become a medium gun, you're probably looking at the $1500 to $2000 range (if you build everything). You don't want to ask what it takes to be a big gun station.

I haven't come across a good program for Windows 3.x, but several DOS programs will run fine under 3.x in Standard Mode (i.e., turn off Enhanced Mode in Windows). You'll need a Hamcomm-type interface -- they don't use a sound card.

I recommend EZSSTV, which has been available at www.ultranet.com/~sstv/

GL

Rich W2RG

Maybe i don't have DOSEMU configured correctly, but EZSTTV won't run under Debian LINUX 2.0.xx, alas. I did read some of the .TXT files, and do have about 17M of free space on D: (where EZSSTV lives, but not on C:, which is a floppy-sized virtual disk) and allocated 8M of memory to it.

"Welcome to dosemu 0.98!"
C:\> d:
D:\> cd ezsstv
D:\EZSSTV> ezsstv

Fatal error allocating DOS memoryD:\EZSSTV>

SSTVBL failed as well, "Error -7 in installing Graphics Mode". FTV didn't do much better (see attachment for error messages), but i didn't make any special efforts to configure DOSEMU accordingly (as i couldn't figure out what the error mesages meant).

Now, 'soundmodem' already does 1200 bps AFSK, so maybe that might be the starting point for an SSTV driver?

Our collage, and just about every school in the country, have dropped MAC's. It seems when the students leave to go into industry, the only people uning them are in graphic arts. So they sold all the MAC's. A friend of mine works for a company who repairs computers for all the school districts in Utah. They were doing the same thing. No call for MAC's in any usefull numbers out in the real world. Seems you have the same problem, because the is no money in writing software for equipment not in popular use. And when it is wrtten it is expensive.
Nothing agenst MAC's here it just they don't have a foot hold any more and administratiors in colleges and schools know it.

Not really HAM satellite but I was so curious about this I wondered if anybody here may know anything.

During the first hour or so of the strike against Iraq (about time) I was monitoring the Intelsat K news feed satellite and on an audio subcarrier of one of the southern american feeds I picked up morse code?. I put it through a decoder and it kept repeating " ATIS READ 11011339-0067999" etc etc . Has anybody seen or heard of anything like this before ?. I feel it may have been a morse identifier for the satellite but I have been monitoring it for about 2 years now and have never heard it before

All domestic (USA) sat uplinks (c and Ku) are required by the FC to run
ATIS id. IT is a cw carrier on a seperate (7.25Mc comes to mind).
When we poll up we come up clean carreir with no modulation except for
ATIS. After the"captain Video" incident (Some loon jammed HBO several
years ago...fired up on their uplink freq and captured the transponder)
The FCC decided that all uplinks had to ID. Of course on our
suyetm the ATIS is jumper in with BNC rf cables and would take all of
30sec to bypass.
You should be able to pick up the ATIS on any US bird.

2997. Observing Jupiter & Io

Newsgroup: rec.radio.amateur.space

From: aaronp@removeme-shore.net
Message-ID: <ds9e2.891$J4.185704@news.shore.net>
Source record: 14399

After success with the geminids I'm now ready to turn my attention to Jupiter. Tonight there is an Io A storm between 7:45-9:15pm est and I'm going to setup on 21 mhz to listen.
Does anyone have any recommendations for this? Should I use CW and L/USB as I did for the meteor shower? Also, I know Jupiter needs to be above the horizon, but does it need to be line-of-sight? I have some small buildings and trees near my antenna that block portions of the sky. Should I try to relocate if jupiter falls behind one of the objects?
Thanks for any help!

2998. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.space
Date: 1998-12-17 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <75b8v4$qqg@news.Hawaii.Edu>
Source record: 14400
Cross-posted to: rec.radio.amateur.space,rec.answers,news.answers

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6OO, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your

article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Thanks Gary for replying to me, I was not
sure if the shuttle actually could produce one that was good enough to make a
contact with or not. Maybe it does not move fast enough through the atmosphere
to ionize it enough and could be the reason the fellows in California didn't
make it happen.
I was just curious if anyone had done it and whether it was possible.
Again thanks for the reply.

That's exactly how I'm doing it now. Post-processing with
perl lets me weed out the passes below the mountains west of town, for
example. I just always wanted to be able to generate them on the fly
instead of having to remember to do tham in advance before every trip.
I grabbed the gcc-based sdk for the pilot, and had a look at the
sattrack source. Now I'm just trying to come up with the time to
write something. I figure I can just steal the geometry engine from
sattrack and leave out the other 99% (most of the user interface, the
X11 code, etc). If I get *really* ambitious, I might read NMEA data
via the serial port for accurate time and location info. It would be
nice to be able to load in a small table of keps and generate data
whenever I want from wherever I happen to be. We'll see...

: It should be possible. I read of some California hams trying it
: when the Shuttle landed at Edwards. I don't think that they
: had any success, but that could have been because the
: geometry was wrong, or any of a number of other things
: could have been wrong.

Apparently I must have been missing something, since I was under the
impression that Edwards is in California near the border to Nevada. In
that case it does not make any sense to try to use the plasma trail in
California. A much better place for such experiments would be far
out in the Pacific :-).

Looking at the typical descent profile for the shuttle (in which d is
the distance to the landing site in km, h is the high in km and v is
the speed in m/s) shows the reason why (use a fixed width font to view
the table):

d [km] h [km] v [m/s]

8800 122 7400
7000 95 7450
5200 77 7360
4400 73 7000
3570 70 6700
2800 68 6360
2060 65 5700
1420 60 4850
900 55 3700
530 48 2500
290 40 1600
140 28 908
61 17 440
39 11 303
23 6.6 220
10 1.6 175

So when the shuttle crosses the cost line of California, the speed and altitude is similar to the flight characteristics of the SR-71 (Mach 3). The greatest deceleration is at about 1000 km from the landing site, so I guess this would also produce the strongest plasma tail.

For best reflections, the signal path should be perpendicular to the shuttle path. A landing in Cape Canaveral should be more useful, since the high speed descent would either be above Mexico or the US (depending of orbital inclination and if the landing is done on the Nort-East or South-East going orbital phase from a high inclination orbit).

I think you'll need to get permission if anyone else were able to use it, as i don't think the copyright on SatTrack would necessarily allow that. I used to run SatTrack on an early Mac laptop [hint to the Pilot folks: SatTrack is a UNIX program], but got discouraged about going very far with it mostly for that reason (and also because it was generating too much RFI given the antennas and rig i was using at the time).

Good point, I'd forgotten that SatTrack has some fairly
restrictive licensing. Perhaps I could pull the ol' AKCL trick. KCL
(Kyoto Common Lisp) had a pretty restrictive licensing agreement. In
order to build AKCL (Austin/Kyoto Common Lisp), you would set up the
KCL source tree in the normal way, then apply a gargantuan set of
patches that changed about 3/4 of the code, then proceeded with the
build. It kept with the letter of the licensing agreement, though it
blew the spirit of the agreement all to heck. ;^) Or perhaps I could
do the "right" thing and talk to Bester (???) and get permission. The
Palm market is so small, they might just agree to it. Especially
since it would be distributed free and nobody would be making any
money from it... Perhaps in my Copious Free Time(tm)...

We had a shuttle night plasma pass over Waco, TX a few years ago

I am in Dallas TX north of Waco. I set my APRS packet to 50 watts
on 145.790 Mhz and send my grid Sq once a min.

I started 1 hr before the pass and keep it going 30 min after the pass.

I was outside during the pass watching the plasma trail at 40-50 Deg up.

One of my packets was copied in Austin TX (south of Waco) during the pass.
None before or after the pass. I did forget to turn off RELAY in my packet path
and may have gotten a free 25 mile bost from another station.

The very bright plasma trail was very interesting

You might want to take a look at the code written in C by N3EMO
(http://www.amsat.org/amsat/ftpsoft.html#src).

I used is as a base and ported it to Java with no problems ;-)

Excellent idea. I grabbed that, plus another called 'orb_cal.c'. Between the two of them, I ought to be able to get something to run...

Source record: 14415
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.space

That would only be true if BPS = baud. As telco modems demonstrate,
that doesn't necessarily have to be so.
[ke4zv@bellsouth.net]

Gary, you probably know i know the difference (as i'm usually the one
to make that point), so you must be letting other folks know. Yes, i
would like to explore using different 'constellations' at 4800 baud.
(Folks, please read a recent ARRL handbook for details.) We might to
be able to get four phases shifts and AM on a good RF path with a 9600
baud compatible radio. And that kind of experimentation one reason i'm
trying to get 'soundmodem' working under LINUX. (Are you familiar with
that, Gary? I could use an elmer for that right now.)

But that approach is best done on point-to-point links, and could be
difficult at best in a client-server model (unless the server keeps
track of separate 'trainings' for each station). Of course, we're
supposed to be experimental and try things that the commercial guys
might not be doing. Hmmm, now that i think about it, i'm close to
line-of-sight with another fellow from computer music realms, and
he also has the DSP chops (and hardware) to try some of these things
out.

For 38.4 _kBaud_ signals you would require about 80 kHz sampling rate.

Is this 38.4 kbit/s satellite downlink signal really two level (38.4
kBaud/s) or four level (19.2 kBaud/s) or eight level (9.6 kBaud/s),
which would determine the bandwidth and sampling rate required.
[OH3LWR <keinanen@sci.fi>]

Yes, two level. As noted in the referenced article, that protocol is a
fairly simple extention of the G3RUH 9600 Baud FSK Modem. But i believe
some of the SETI folks are using the faster sample rates and moby FFTs,
so whatever affordable hardware works for some of them may be adequate
for 38.4 bps FSK as used on TMSAT.

Likewise here Ian.

I had a look at your web page and was really jealous of the quality and range of pics which have been rxd in the US.

Only got 3 here so far (and nothing in the past few days although I've been monitoring the 70cm as well as the 2m fx) Those 3 were far from inspiring as all they show is a black sky and an overexposed white solar panel with just a bit of gold craft.

Humph!

The problem is I need more on air pics to make sure I have the Robot 36 rx set up properly.

I had come to the conclusion that the experiment had stopped - maybe someone can confirm if pics are still being sent in other parts of the world.

I really hope this experiment continues as it has generated lots of interest in SSTV locally and from what I have seen in many other areas.

3015. Elevating yagis

Newsgroup: rec.radio.amateur.space
Date: 1998-12-18 00:00:00 UTC
From: JayCee <jaycee@nospam.demon.co.uk>
Message-ID: <ryDnRXAovre2EwGx@midmarsh.demon.co.uk>
Source record: 14417

I'm thinking of getting some elevation control on my normal tropo setup (2m and 70cm) In their horizontal position I can work the FO birds and AO-10 but obviously it only works well when they are near certain elevations from my QTH.

Near the horizon is good as is about 12deg and reasonable at 25deg. The main problem is finding positions where the vertical lobes of the 2m and 70cm beams are equally good.

At the moment I cannot afford full control for elevation; reasonably powerful rotators being very expensive. As I only need a certain amount of movement, maybe about 30deg to give me better control over my sigs, it was suggested to me that I design a system to use a dish screw jack.

This seems a good idea as, with my favourite AO-10 at least, I don't need high speed adjustment. If they are made to hold largish dishes against the wind they ought to be able to hold a couple of 5m long VHF / UHF beams, hopefully. It is certainly an interesting challenge.

I was wondering if anyone uses (had used) such an idea and how well it works and any tips or pitfalls to pass on. Or - maybe even another suggestion or possibility for home brew on this topic.

How big are the antennas? If they are spaced out and ballanced on the boom, some of the old u-100 modles will handle quiet a load. It does not take much to elevate a ballanced system.

Source record: 14420

Maybe the Microsoft monopoly had a part in this? Maybe it was the fact that the MAC OS does not offer the advantages with respect to its competitors that it once did? Maybe I can get a PC that does more for less money? Also the MAC has had very inconsistent approach to the industry. At one time you had third party vendors now you do not. I feel this is what killed the MAC. The decision to pull out of third pary vendors was based on the fact that they compete with the real MAC. The killing point is that they were competing with the PC. Now they have no competion and no business. I think that a corporation, that has a solid product in todays IT climate should not languish. Something is wrong at the top. I mean you could focus on markets that are now ripe for creativity. The JAVA language does not require a specific platform to be useful. You could develop JAVA applications that work on any platform and provide them free to MAC buyers and you could sell them to PC users. you could have internet services for MAC buyers that allow them to leverage the MAC OS. I am waiting for the first JAVA based office application, JAVA Office! Now in the big scheme of things this may sound naive but JAVA was creation just like the MAC OS. By creation I mean there was an innovative spirit involved and not some business man somewhere micro-managing the project in anticipation of required revenue. These micro-managed projects are doomed to failure becuase they are self-serving and it is very apparent, case in point Micro-Channel. Micro-Channel was an idea that you can have jumper-less components that can be configured via software. You paid IBM more money for these components. Micro-Channel is now dead and we have Plug-N-Play which is the same idea without the IBM overhead. It's strange IBM has had so many ideas that others have profited from yet they languish behind Dell and so many others. What does this have to do with SSTV and MIR, very little!

I've tried several under DOSEMU, but so far, nothing works. I've picked up
WINE but it barfs on the MSDOS programs and i haven't pulled anymore over
that are specificly Window3.1 (and i don't know if WINE runs W'95/98 code).

Hello again here is a picture I just captured from mir
12/19/1998 15:45 utc
I am using a kenwood 241a transceiver
2- 13b2 cushcraft beams up 40 feet
I can not elevate them so I have to shoot the space
station when it is on
the horizon, under 20 degrees this picture was
captured at a range of
about 1200 km.
Glad to share them .

Hi all,

Just a quickie, I have put a few more pics in the gallery (expanding all the time). These are from operators and enthusiasts around the world

http://www.kmedia.freeserve.co.uk

Anybody wishing to add their pictures to the gallery feel free to e-mail them to me (keep them as *jpg files or at least a sensible file size!), and I will add them to the gallery along with your name and call sign
I also have the latest information on MIR transmissions over UK and from other sources as i get it, take a look it may be of use ?.

Thanks

Ian Koenig

Thanks Ian. I copied a few images during passes over the N.E. U.S. today. I downloaded W95SSTV this morning and it works great! Mir's antenna must be at a bad angle though, signals aren't that hot today. But I DID copy images! I'm using a mic in front of the speaker for now, works very well.

>home computer?

You can do pretty much everything you need with Microsoft Word (use
the Mail Merge feature in Word to pull data from your log program).

Yep. I do the same thing on a Macintosh with WriteNow. It may stay there
for awhile until LINUX/Ghostscript can learn about '6 color' Epson printers.
Albeit, in my case, some Perl5 code reads my personal abbreviations in my
logs, extract valid QSOs, and will soon weed out those where i've already
sent out a card from a given grid squares (since over a period of a month
or two, i routinely work out of three or four different grid squares).

But if you're going the LINUX route, Star Office will probably do the mail
merge thing for you.

One thing you'll probably want to learn about (if don't know about them
already) is 'tables', so you can do a nice looking layout.

Cardstock is easy to obtain - get some 80 to 100 lb. paper at your
local mega-office-supply and take to the nearest printshop. They'll
cut it down to QSL card size (3.5 x 5.5) for a couple dollars or less
(I got mine done free). Then your all set to print directly to ...

You don't even need to go to that much trouble. I just get 4"x6" unruled
index cards (available in most large 'drug stores'). I got a 'personal
trimmer' [mini-paper cutter, costing *much* less than the conventional
kind] and that cuts them to size (3.5"x5.5"). You may have to do that,
anyway, because most printer won't print up to the margin, as they need
to hold the paper in place somehow. I do have 8.5"x11" card stock, which
i use for other purposes (like greeting cards); it's much cheaper by the
ream than index cards but less convenient unless you have someone to trim
it to 3.5"x6" or 4"x5.5" (depending on your paper path).

& PLEASE trim your cards to postcard size before sending (or at least
& don't have your text/graphics exceed that), as otherwise it messes
& up most everybody's storage system. Nor would it look as nice on a
& wall as those that fit the informal standard and may not go on a wall
& as a consequence. (A postcard also fits into a letter-size envelope,
& and a 4x6 index card does not.)

If you're using an inkjet printer, test your cards for smear resistance,
once the ink drys, with a wet finger. If it fails that test (mine do),
then you may want to spray your cards with 'Krylon' or other protective

agent intended for artwork (try graphics arts store). You never know what the mailbox is going to be like at the other end. You can still write on them later, if you need to add an additional note or make a correction.

-- KD6PAG ("Networking Old-Timer, RF newbie")

P.S. Work me on AO-27 if you want a sample.... *grin* (With apologies to those 'down under' or on the other size of an ocean from me.)

I am just advising you because i made the same mistake myself once and
all it takes is ONE person to complain to your ISP and your news
access will be stopped. ESPECIALLY with DEMON internet because that's
who I was with at the time !.

Web sites are for pictures that is why i have constructed a gallery of
MIR pictures that people are sending me from all over the world at
htttp://www.kmedia.freeserve.co.uk
Feel free to vote or do whatever you wish, i don't run this
newsgroup, but i fear you may run into problems in the near future if
you do.

The best thing would be to arrange somebody to put forward a binary
group that is related to this one

regards
Ian Koenig

Good idea - now how do we set up a binary group? Anyone know?

Hmm there again there may be hardly enough traffic to justify it. (It's
not me posting them Ian - I just think they are interesting)

Getting a binary group through 'comp' can be pretty hard and i don't think you'd get enough votes to make it succeed. Heck, if that kind of effort is made, it should be to restructure the entire 'rec.radio.amateur' hierarchy, in which case, this would be just a part of much bigger picture, less likely to stir up controversy, and more likely to get enough votes.

If you want an 'alt' newsgroup (where most binaries go), then propose it to 'alt.config'. However, i strongly recommend that you make it a moderated (or robo-moderated) newsgroup, or you'll get lots of X-rated spam. If you want to read the relevant FAQs (i'll get you pointers if you need them but they are posted frequency to 'alt.config), i'll be happy to review and/or fine-tune the proposal, and help run it thru their process.

3035. PC DDS Signal Generator

Newsgroup: rec.radio.amateur.space
Date: 1998-12-20 00:00:00 UTC
From: tracy@bytemark.com
Message-ID: <367d5f31.249878111@news.earthlink.net>
Source record: 14103

For one week only, (December 20 - 26) The PC-VFO DDS Signal Generator
will be available for $119, a $20 savings over the regular single unit
price of $139.

You can find information about the PC-VFO DDS Signal Generator at
http://www.bytemark.com/waveguide

In order to receive this special price you MUST place your order using
one of the following two methods --

1) TELEPHONE
Toll-Free at 800 679-3184 or 407 679-3184
STATE YOU SAW THIS NEWSGROUP POSTING AND REQUEST THE SPECIAL PRICE

2) SECURE WEB
a) Click the following link or paste into your browser:

https://cybermall.orlando.com/Mall/showdetl.cfm?&DID=6&Product_ID=888&CATID=23
(you must put the 's' after the 'http' to get to the secure site!)

b) Click the 'Add to Basket' button

c) Enter your information

d) In the 'Message' Field, enter
ONLY CHARGE ME $119 FOR THIS CARD

Your confirmation will still show $139 as the price of the PC-VFO, but
you will only be charged $119 plus shipping.

The CyberMall site gets VERY busy ... If your order cannot be
processed please use method 1!!

THIS OFFER IS NOT ADVERTISED ANYWHERE BUT THE NEWSGROUPS AND VARIOUS
MAILING LISTS.

Delivery will likely NOT be before the Christmas holiday unless
special shipping arrangements are made. Contact the sales department
directly for special deliveries.

Have a safe and fun holiday season!

you could be right there, I do know it has to go through some sort of
vote or something?, and as you say their probably would not be enough
to represent it...perhaps we should all do something about that !.

Ian Koenig

i will see what i can find you about the process

That is one of the sort of reasons why I like this particular group so much, no spam, no binaries, polite people etc etc. Much different to some other "ham radio" groups I can think of which I do not even bother with anymore.

I do think that as a couple of you have said there would nt be enough to vote a binary group into being, perhaps then we should turn to the binary "astro" group ?, or better still web site the material or post a link !

3040. SPUTNIK 41 (RS18) IS DEAD OFFICIAL

Newsgroup: rec.radio.amateur.space
Date: 1998-12-20 00:00:00 UTC
From: ian@kmedia.freeserve.co.uk
Message-ID: <367f83e1.45845741@news.freeserve.net>
Source record: 14108

For those who don't know yet I just got an e-mail from the president of Amsat france to confirm that the MIR launced Sputnik-41 (RS-18) micro satellite is officially dead. It lasted well and for the 30 day battery life that was expected from it.

I myself had many qso's with the satellite with extremely good signals using a 0 gain antenna on a hand held which is quite good when you consider the 200 milliwatts power output it was putting out !.

Thank you to Aï¿½ro-club de France, the Russian Aeronautical Federation and AMSAT-France. Gerard auvray and all involved in the project for a succesful and enjoyable endevour !

I am sure we are all looking forward to your future projects.

Ian Koenig

for those interested in reading more about the satellite go here..

Hi
We have done a lot of jupiter listening .. listen in the 18 mcs area in a clear spot we use lower sideband as most rigs have better results on lsb...there are several distinct sounds from the planet and they are like someone swishing a vfo thru ur spot on the band ...one like distant machine gun fire and one like the surf coming in... these will be random ..so setting a tape recorder or a recording computer program with a good interval will give u good results.. let us know how it goes.. seasons greetings pete k7ztm

Looks like it was shot out of one of the windows to me. The object on the
left side *may* be a solar panel or another part of Mir in direct sunlight.

The screw jacks work great. They're strong enough to handle really large arrays. You can get nearly 90 degrees of elevation using one of these, and position control is very fine if you rig up a controller to work with the shaft encoder.

You need to rig up a lever, called a control horn in aircraft circles, horizontally back from the cross boom to act as the point where the actuator connects to the antenna array, and weld a simple ear tab on the vertical mast for the other end of the jack. You want the geometry of this to be so that the jack moves through nearly its entire travel bringing the antennas from horizontal to near vertical (don't let it go exactly straight up, the mechanism can hang, called toggle locking, or invert and bring your antennas back down upside down).

You have to arrange for the crossboom to rotate in its supports without being able to slide sideways. A pair of hardware store pillar bearings and collars will hold it in place, but it would be better if you could use a couple of tapered wheel bearings on the crossboom. If you mount them so that the tapers are opposite, that'll hold everything aligned with much less friction. The bearings would ideally be pressed into a mallable iron housing machined to accept them, but you can use a hardwood block reamed to hold them in a pinch. I'll leave it to you to scout your local bearing and drives places to find bearings that will fit your crossboom diameter.

don't post binary's to the group !. I cannot see it anyway because
binary's are automatically destroyed in a non binary group on this
server. but looking at this message it looks like you may be posting
binarys's, i am onl;y saying this inase you get a moaning at from
others

currently due to some tech problems thay are intermittently sending
sstv on 145.985 +/_ doppler. eventually they should move it to
437.9750. keep an eye on this page for information

Perhaps we should vote on this; I can receive the pictures and think it
is very interesting to see what people are getting (And relevant to this
News group) - so I would say go ahead and post; with the provision that
the .jpg size is kept to a minimum.

Maybe you should consider changing your server Ian? (I know Freeserve
are generally very good compared to Demon - who have been less than
perfect recently!)

3053. CW sigs on AO-10

Newsgroup: rec.radio.amateur.space
Date: 1998-12-20 00:00:00 UTC
From: JayCee <jaycee@nospam.demon.co.uk>
Message-ID: <AV1d4CA0BMf2Ew4P@midmarsh.demon.co.uk>
Source record: 14443

Every day recently I've heard the same CW on AO-10.

It does not call CQ but appears to be sending the same thing over and over, usually on a downlink fx between 145.905 and 145.915 It is there for a short while, then a gap of several mins and then appearing again, etc. over and over.

Unfortunately as I am only just starting out learning CW and it is fairly fast I can't make much out (I can only pick out an S and 99) so I wondered if anyone else knew what it was.

Yesterday, even though the bird's beacon never got past S5 to me the CW was peaking 9+ so I guess whoever is sending it was using a fair amount of unneeded power.

It really depends on what the charter said when the newsgroup was
formed. Most, if not all, will forbid binary postings in non binary
newsgroups.

It is normal for many ISPs to filter out the binaries simply because
they are forbidden in the charters for those groups.

If the group were to be flooded with binaries then phone charges would
become significant as far as I'm concerned which would mean having to
switch to browse and then downloading articles later.

Placing the pictures on a web site and just giving a url pointer for
those interested is better. Not everybody here may be interested as it
is for general discussion of all amateur space related topics.

Just my ha'penny worth ;)

From: John Mock <kd6pag@qsl-nojunk.net>
Message-ID: <8790g1ewjc.fsf_-_@mongrel.kd6pag.ampr.org>
Source record: 14114

you could be right there, I do know it has to go through some sort of vote or something?, and as you say their probably would not be enough to represent it...perhaps we should all do something about that !.

Only for the 'rec' or other Big N hierarchies. 'alt' has its own rules; they're much more about persuasion and have little or nothing to do with conventional USENET voting procedures. Please read the FAQ's in

ftp://rtfm.mit.edu/pub/usenet/alt.config/

And i recommend you start with

.../alt.config/So_You_Want_to_Create_an_Alt_Newsgroup

Then come back with more questions. You should also read the existing newsgroup, 'alt.binaries.pictures.astro' and see if things fits there. Do that before posting to 'alt.config', because some on 'alt.config' will likely ask the question anyway. It may be, for example, that SSTV is unwelcome there or anything closer than the Moon.

-- KD6PAG (Networking Old-Timer, "RF newbie")

P.S. The newsgroup that i helped get through 'alt.config' was a so-called 'Top Level' alt newsgroup, something strongly recommended against in the above article (unless a good justification is supplied). It was really an uphill battle, but we provided that justification and it was eventually created. Your idea may be easy by comparison and i'm willing to help.

FT847 MINT Condx!
Barely Used, But must sell for personal reasons.
NOT a pre-production model! I called Yaesu with serial number
and was told that it was produced less than 2 months ago!
ALL bugs are gone! Great for satellite, and excellent on HF.
Comes with Hand Mic and MD-100 Base Mic ($175 value)
In box with ALL original paperwork, manuals, warranties, etc....
Warranty good till NOV 1999. (Shows how long I've had it)
$1600 (Only serious buyers please)
This setup would cost you More than $2000 Brand new.
and this rig is just that.... BRAND NEW

Not that correct grammar is the aforementioned site's strongest point
anyway. (allegedly)...

I said it that way, CANT, as it was meant to be shouted and stroppy if I
had wanted to say it properly I would have said No you can not as there
is no such word as Cant or Can't so lets have it totally correct shall
we? - what a waste of bandwidth - sorry guys on u.r.a
regards and seasons greetings

3073. TO-31 info sought

Newsgroup: rec.radio.amateur.space
Date: 1998-12-23 00:00:00 UTC
From: JayCee <jaycee@nospam.demon.co.uk>
Message-ID: <73LzQFAy7Og2Ewkv@midmarsh.demon.co.uk>
Source record: 14126

I've tried many searches of the www, the TMSAT site and Surrey but can't seem to find details of how to rx and decode the picture info from TO-31 and how to contact it. I think I've browsed about 30 sites but I guess I haven't found the right place yet :(

I've monitored on and around 436.925MHz but heard nothing as yet. Are the pics broadcast continuously or do they have to be requested?

A pointer to somewhere with detailed info (how to, software needed, etc) will be gratefully received as I've only ever worked voice sats and the occasional attempt to connect to the eternally busy MIR PMS.

As far as I know they are not sent out until 1 month AFTER the death
of the satellite which should mean they will be sent out around 10th
or 11th of january. I think this is to allow people to get in last
minute qsl's

John,

TMSat uses the standard Pacsat Broadcast Protocols (just like UO-22, KO-23 and KO-25). You will need a 9600 baud modem and either PB/PG, WiSP or my JStation software to download the data.

You cannot really hear the downlink as it just sounds like white noise, but should be able to see the signal level rise as the satellite comes into view. You will also need to adjust for doppler shift.

The AMSAT-NA web site has some information on PB/PG (for DOS) and WiSP (http://www.amsat.org). My web site has information on JStation (http://www.qsl.net/n6lyt).

Once the images have been downloaded. I have a TMSat image viewer in Java, and Colin Hurst (VK5HI) has modified his viewer to handle the images.

3077. Mir USA East/West packet feeds

Newsgroup: rec.radio.amateur.space
Date: 1998-12-23 00:00:00 UTC
From: Walter Dunckel <wdunckel@best.com>
Message-ID: <36811782.CFD06CF5@best.com>
Source record: 14130

Just to let you know, you can view real-time packet feeds from the East and West coast of the USA via the following telnet site. This makes it easier to see if Mir's PMS is occupied, or if you have been received by Mir. You often get an idea of what messages have recently been uploaded, making it more efficient to decide what to read.

telnet://www.aprs.net:10001
(the above site does not hold "historical" data- only live data feeds)
This makes it pretty boring, UNTIL a pass of the satellite!

If you would like to view "historical" (updated every 20 minutes and cleared out at the end of each day) data, you can at the following site:

http://www.best.com/~wdunckel/ham.html
(see mirpass data)

3078. sattelite tracking program which runs on Linux

Newsgroup: rec.radio.amateur.space
Date: 1998-12-23 00:00:00 UTC
From: nl11891@AARGHamsat.org
Message-ID: <367f99ef.2266094@news.demon.co.uk>
Source record: 14131

Hello,

Can anyone mention (or even recommend) a sattelite tracking program
which is running on Linux OS ?

I currently use PC-Track.
I'm looking for the same fuctionality (at least predicting passes of
selected sattelites so that I can print them) as PC-Track offers me.

Thanks for your attention.
Merry Christmas and a DX-full 1999!

Robert Joosten, NL-11891.

I use SatTrack version 3.1

It was available for free from Bester tracking:
http://www.primenet.com/~bester/sattrack.html

The site is about a newer version which isn't free, but probably you
can find version 3.1 on other FTP sites.

It is a nice program. Both realtime calculation and tracking of one
or more satellites, and prediction of passes. Also a graphic display
of groundtrack and coverage area.

Example text window:
SatTrack V3.1 GROUP AM MULTISAT TRACKING DISPLAY PE1CHL

Hi Alan,

>A few things to check. First, make sure you have the "real" TO-31!
>There was some confusion early on, and several different object
>numbers were used. The current correct one is 25396. Most of the
>keps after day 352 have it correct. It is broadcasting constantly,
>and with a good signal.

My keps show being 2 days old and the number 25396 so I'll do a bit of checking.

For reception, once I can find it, I'll be using my IC821 which is 9600 'friendly' don't know about 38400 though ;)

Txn for help. John

Hi John,
>TMSat uses the standard Pacsat Broadcast Protocols (just like UO-22, KO-23 and
>KO-25).

Doesn't mean a lot to me yet but at least I know what I'm looking for
now ;)

>You will need a 9600 baud modem and either PB/PG, WiSP or my JStation software
>to download the data.

That's why I picked up a s/h AEA DSP232 so I hope it will do the job. It
isn't so hot even on ordinary 1200 packet. The rig is an IC821 so it has
a 9600 output at least.
>
>You cannot really hear the downlink as it just sounds like white noise, but
>should be able to see the signal level rise as the satellite comes into view.
>You will also need to adjust for doppler shift.

Hadn't noticed even a lift in noise levels as yet and I kept tuning
+-20KHz just in case. Looking at what another reply says I may not have
the correct keps yet.

It sounds complicated but worth investigating. As the wxsats are mainly
transmitting in darkness and MIR doesn't seem to have sent any SSTV for
quite a while over Europe I'm getting withdrawal symptoms on the lack of
decent imaging here ;>)

Tnx again for the info, John

I am using an Icom 821 also, but use the Motorola 56002 DSP evaluation board. In it's standard form, the 821 will not work at 38k4. I am investigating using an Icom PCR-1000 for the 38k4 downlink. Currently, there are problems with the downlink at 38k4, which may be resolved when they try the secondary tansmitter.

The pictures are really good, especially the sequence of images that they can take.

Actually, to me reading that article makes me think that it's more wishful thinking than anything concrete. Of course, the Russians don't have the 'truth in PR statements' rules that the Securities and Exchange Commission puts on US companies that make such claims, so I'd suggest you take the info with a grain of salt until harder information becomes available.

My completely off-the-wall guess... yeah, Mir might be up there in three years, but I'll bet it's not going to have any riders aboard by then.

Time will tell, I guess.

I have 80+ of these relays. They are 24 volts dc, rf relays. THey have good performance up to about 1 GHz. They are douple pole double throw. I've used them in RF attenuator circuits, where you either switch thru or thru a pad using only one relay. They take about 20 watts at the low frequencies. They can also be used to switch in delay lines etc.

Price is 3 for $10
10 relays for $25
25 relays for $40
80 relays for $100

It's by Bryan Burrough, ISBN 0-88730-783-3

"Dragonfly - NASA and the crisis aboard Mir" is the full title.

It's about the various problems and troubles Mir has had and the cosmonauts
and astronauts (and ground people) who endured them. This is a MUST have
book, hard to put down. I hope someone writes another one!

Merry Christmas to all!

Santa left me a copy of DRAGONFLY, the new book about Americans on Mir. Very interesting. Frequent (and so far positive) mention of the moral support provided by the ham station.

On 24 December the Washington Post ran a story about a new web site

terraserver.com

They have USGS and Russian (Spin-2) images for a good portion of the planet. I was very quickly able to printout pictures of the house I grew up in (New York) , my house in Virginia and a house we lived in in The Dominican Republic. Very FB stuff! Check it out!

Hubble telescope and space photos are at

Http://home.talkcity.com/basinst/musickey

Compare your radio images to optical!

You can retrieve photos for most co-ordinates
from the archive plates of the sky data base

Also use as a observatory while in irc chat (use chat4tv, and select O
on far right of menu).
for group discussions in the room and server of your choice.

3111. Mode A Birds

3113. Web site update (mir)

Newsgroup: rec.radio.amateur.space
Date: 1998-12-28 00:00:00 UTC
From: freeserve <ian@kmedia.freeserve.co.uk>
Message-ID: <768slt$301$1@news6.svr.pol.co.uk>
Source record: 14166

Hi all,

just to let you know I have updated the Koenig space web site.
It is now optimised for IE4 (sorry but i get tired of trying to please all browsers). You will need real player G2 which is free and will enable you to watch the real video clips that will put there when i get my new capture card so i can make the video files. The files will include video captured from live satellite feeds during missions etc, and anything else relevant to space etc.

If you have any comments or suggestions please mail me and i will see what I can do. Please bear in mind that there are some areas not totally completed yet

Note: It will also have an active channel so you browser can automatically update you with MIR reports etc.

thanks

Ian Koenig

3118. Amateur GPS system?

Newsgroup: rec.radio.amateur.space
Date: 1998-12-29 00:00:00 UTC
From: Cathryn Mataga <cathryn@junglevision.com>
Message-ID: <3688BE83.2C69FE24@junglevision.com>
Source record: 14171

This is a goofy idea I had. Would it be feasible to make a ham GPS sytem -- that is independent of the
official 'military' GPS system? I was thinking, and maybe I'm missing something hugely obvious and stupid
here, that all you'd need is a satellite where you knew accurately where the thing was located. Stick
up a really accurate clock up there, and then check how long it takes that signal to reach synced clocks on
the ground. Use the delay to triangulate your position from the the satellite makes a few passes. Do a
little trigonometry and figure out where you are on the planet. Err, or maybe there's a better more accurate
way to do this. And, I'm not quite sure what the use would be, apart from being the 'emergency backup'
to the regular gps system. Still, I wonder what it would take to beat the accuracy of the 'civilian' gps satellites -- given a much slower response, of course.

The past 2 Nasa orbital tle sets have resulted in Mir being 20 minutes behind schedual in stsorbit plus. Anyone else have this problem? I just got #351 this morning, I'll check how this set is. I can't find a problem in my settings yet to cause this difference.

Anyone?

Source record: 14176

Don't forget the pesky Quandrantids the evening of Jan 3-4. Although a bright moon will obscure visual observing it won't have an effect on radio listeners and scatter enthusiasts.
The IMO states peak is at 2300UT while "Meteor Showers: A descriptive Catalog" places it at 17-21UT. ZHR is 45-200 with bright bluish meteors circa 2.8mag.

I noticed the same thing, I hadn't ruled out cockpit error yet
but you seem to have done that for me.

3126. Re: What became of the Apollo 13 LEM?

Newsgroup: rec.radio.amateur.space
Date: 1998-12-29 00:00:00 UTC
From: "Louis L. Broad" <llb@llb.mv.com>
Message-ID: <36895804.19D1@llb.mv.com>
Source record: 14179

The comand module, service module and LEM were all on a trajectory for entry into Earth's atmosphere at 25,000 mph +. The command module (apollo capsul) was the only thing designed to re-enter.

per the info page at NASA-

Description
The Apollo 13 Lunar Module (LM or LEM) was originally supposed to land at the Fra Mauro region of the Moon. The Apollo 13 mission was aborted as a lunar landing mission on 13 April 1970, 2 days after launch, when an oxygen tank overheated and exploded. The Lunar Module (LM or LEM) was used as a lifeboat to house the three astronauts (Commander James A. Lovell Jr., CM pilot John L. Swigert Jr., and LM pilot Fred W. Haise Jr.), as the CM could not provide life support. The Apollo 13 continued on to the Moon, and the LM descent engine was used to accelerate the
spacecraft around the Moon and back to Earth. **** The LM was
jettisoned shortly before reaching Earth,**** the astronauts returning to the Command Module for the reentry.

>Ask the folks in sci.space.history.
>Tom
why? I asked Dr. Williams @ GSFC, Greenbelt MD
.
If that "High School" physics teacher who responded to this thread could only provide that lame answer, the student populace of this country is in deep-deep dumbed-down trouble.

i know that either the LM, or SM (Service Module)
did NOT partake in Earth orbital insertion on this mission,
'cause Frank McGee, or Jules Bergman, or Walt Cronkite told me so.
Kudos to the original poster of this quierie, keeps the "Jepordy" fans on their toes!!

3130. Mir Story on CNN.COM

Newsgroup: rec.radio.amateur.space
Date: 1998-12-29 00:00:00 UTC
From: Paul Heaney <nofixxxerr@attcanada.net>
Message-ID: <2%fi2.163$id.71@cabot.ops.attcanada.net>
Source record: 14183

Here is a copy of a headline about Mir captured today from CNN.COM

MOSCOW (AP) -- Cosmonauts on the space station Mir intend to have a traditional Russian New Year's celebration in space, including a tree, a weightless Santa Claus and gifts, a Russian news agency reported Monday.

The news report did not explain how the cosmonauts managed to get a tree into space. Nor did it say who would don the long robes and beard of Grandfather Frost, Russia's Santa Claus.

Most Russians either ignore Christmas or hold primarily religious observations on January 7, the Russian Orthodox Christmas.

The major winter holiday remains New Year's, for which Russians have adopted many practices associated with Christmas in the West.

The cosmonauts' families were allowed to send New Year's gifts to Mir in October.

"We have to ... write on them, 'Do not open until December 31,'" said Maria Avdeyev, the wife of cosmonaut Sergei Avdeyev.

The cosmonauts have stashed some delicacies for the holiday, the ITAR-Tass news agency reported.

Russian space agency rules prohibit cosmonauts from bringing liquor aboard Mir, but it is apparently a rule that was made to be broken, and vodka has found its way onto the space station in the past.

Oh, the world hasn't stopped for P3D. And, I don't think this would be something
for it's own satellite, but rather, like, a gadget that could go up with another satellite.

3132. Need info - ISS and Radio Astronomy

Newsgroup: rec.radio.amateur.space
Date: 1998-12-29 00:00:00 UTC
From: Catherin Gregory <catherin@islandnet.com>
Message-ID: <3689C30D.705EC9CB@islandnet.com>
Source record: 14185

Hi and Happy Holidays...

Here in the Pacific North West we get a lot of rain. Tonight 6:05 - 6:20, as patches of cloud whipped@70Km over this evening's sky I observed ISS first time!(Yippee!) And it was moving as fast as the clouds~then it moved right into the glare of the moon and I lost it.

Now I have to get the orbital elements for my software for sure.

I've tried a couple of sites for current ISS orbital elements, including http://celestrak.com/NORAD/elements/index.html and AFIT. But what I found is only for Zarya I think.

Also, I'm confused about the NORAD name is it ISS, or STATION?

Can someone point me in the right direction for today's data. Also, does anyone know what is happening with Nasa'a J-Track? Unity isn't there! Has everyone gone on holiday? :-)

Also, due to my weather, how practical is amateur radio astronomy anyway? I've read http://www.signalone.com/antennas/
and some info on spectrum analyzers BUT, it definitely looks like a club project in size, knowledge and cost. Right? It isn't the type of activity I can pursue from my apartment in the city, is it? Oh sigh, at least we have internet astronomy.

Clear Skies!
Catherin

We can not even get phase 3d in the air , and it is built we dont need
more stuff we can not afford to launch.
Good idea though.
I am still banging my head on packet,LOL :-}

Catherin,

If you load up the Elements for Zarya, you'll find the station. Zarya is a module of the ISS, the same as Kristall is for Mir. I discovered this ages ago when using a program back on my Amiga, when Mir popped up so did Kristall and I saw that they were in the same orbit, at the same altitude, so I checked it out, since it's another satellite attached as part of the station, it's listed as it's own satellite.

Mir is a Module on the station. The main Module. (Someone will correct me if I am wrong of course)

If you track Zarya, you'll track the station. Good luck.

Paul.

Hi

I friend of me HB9VBO want satellite-Skeds with Oceanian stations.

I QSP your message to HB9VBO

Thanks in advance and best 73's.

HB9ICC Sebastien
hb9icc@hamradio.ch

Heh that's quite a dish. Looks like you have to be out in the country to
have space for one that big.

Here is where I get my Keps.

http://spacelink.nasa.gov/Instructional.Materials/Multimedia/Satellite.Tracking/Current.Satellite.Tracking.Elements/.index.html

Is updated regularly, and has a whole wide range of sats. If you check the recent file you'll see that Zarya is now designated "Zarya (ISS)" For International Space Station.

Paul.

3140. What have we got here?

Newsgroup: rec.radio.amateur.space
Date: 1998-12-30 00:00:00 UTC
From: Paul Heaney <nofixxxerr@attcanada.net>
Message-ID: <gjAi2.3062$fz5.153@tundra.ops.attcanada.net>
Source record: 14193

Looking through NASAs Latest Orbital Elements, I came across a couple designations which were interesting.

STS 88 DEB

Which I'm assuming is Debris from the STS-88 Mission

SSN-23 DEB
SSN-23 R/B

What is this? Is SSN Not a ship assignment for the US Navy? I thought SSN-23 DEB Might be debris from a Military launched rocket. but the SSN-23 R/B Designation indicates a Rocket Booster.

Anyone know what these are?

Thanks

Paul.

: least we have internet astronomy.

I'm in the process of putting together an amateur radio astronomy for newbies page. Stay tuned to this newsgroup for a notice when its ready. There isn't just a whole lot one can do with RA, but what you can do is very neat and relatively painless. One of the major advantages is that weather has (almost) no effect on observations. Also lots of stuff can be done from an apartment in a city.
Also visit SARA at: http://www.bambi.net/sara.html It's a great starting place for radio astronomy help.

Hi There,

Has anyone worked out a mod for the ICOM R-8500 or R7100 to opem up the Rx IF to 50Khz so as to better decode the WX Sats? If so when can this information be found? Both are great receivers, just one short comming.... playing with a loaned Icom PRC-1000 with the 50Khz IF works very well but dosen't help me with my equipment

Thanks

John

3145. GPS receiver

Newsgroup: rec.radio.amateur.space

From: Mark Waldron <bogart@nationwide.net>
Message-ID: <368B2463.51BE9D8@nationwide.net>
Source record: 14198

I am looking for a suitable GPS receiver w/ NMEA data out
for APRS, etc., and am curious about the DeLorme units that
come with Street Atlas or Topo (a.k.a. Earthmate). These units
will hook up to the 3Com PalmIII, display streets/topography
on the PalmIII, and it would be nice if the receiver could also be
(separately) used for APRS position reporting.

The DeLorme website claims that to get the PalmIII to work with
a GPS receiver, it must have NMEA data out. Same goes for
APRS-compatible GPS receivers, yet I have not seen or heard
any mention of folks using the DeLorme units for APRS.

Any input is greatly appreciated.

Interesting reply, but you seem to have totally ignored the Linux issue.
Luckily for us, Corel, IBM, Netscape, Informix, Oracle and Sybase
haven't. Only problem is, I don't think they produce any SSTV software.
Still I suppose there's always the DOS emulator and that DL?SAW
software...

Hi gang,
Heard one of the cosmonauts working voice this morning during the 1316utc pass over N.Y. I didn't get through myself but several folks did. Some people were still using packet during the pass. He was also calling for Miles. He wished several folks a happy new year. Not sure which cosmonaut it was though.

An SSN-23 is a Russian SLBM (submarine launched ballistic missile). This
one was used to launch a satellite from a Delta-IV submarine some months
ago.

SSN (in this case) = Surface-to-Surface, Naval.
It's part of the US/NATO nomenclature for foreign missiles that contains
SS, AS, AA, SA, SA-N, etc. designations.
See Jane's.

You'd have to have very accurate clocks. If you want a backup system to
GPS, there is always the Russian GLONAS system. Ashtech make GPS/GLONAS
receivers which will take the best sattelite data from whichever system
to give an accuracy of around 20m - that's without differential beacons.

Oh that's a shame. I thought you'd be able to get stuff working under
DOSemu :-(Anyway, as for Wine, well they're working towards Win32
compatibility, and I heard about a month back that Corel were beginning
to help as well, and had already got a fair bit of Quatro Pro (whatever
that is) working under Wine. In the meantime I'll keep looking out for
Linux SSTV stuff and post something here if I find it. Alternatively, I
have one of these little interfaces and could probably write something
myself if someone could point me in the direction of a site which gives
details on the various SSTV standards (modes?).

We have much of this already - people will be doing precision ranging
measurements to track P3D, and are testing the hardware and
software now on AO-10. See G3RUH's article in the AMSAT Journal
not long ago.

The key is accurate time keeping - GPS and GLONASS satellites
use atomic clocks to keep very accurate absolute time. However, if
you use an active system that measures transit time to orbit and back,
all you need to measure is time intervals, which we can do
(relatively) easily to the required accuracy.

I already did - their proposal had too many license classes and too much code.

Brian/N0iMD

Try posting your request to sci.geo.satellite-nav. That newsgroup is almost entirely devoted to GPS questions, answers, and discussions.

I believe that all the handheld GPS receivers on the market today put out NMEA data. I have two, Garmin GPS-40 and a Garmin GPS 12-XL. Both of them put out NMEA 0180, 0182, and 0183 v 1.5, and a proprietary Garmin format.
